SdAR-1, modified river sediment*

Abstract

Results are presented for GeoPT31, the subject of round thirty-one of the International Association of Geoanalysts' Proficiency Testing programme for analytical geochemistry laboratories. The sample distributed in this round was SdAR-1, a modified river sediment, supplied by Dr Stephen Wilson of the U.S. Geological Survey. In this report, contributed data are listed, together with an assessment of consensus values, consequent *z*-scores and charts showing the distribution of contributed results and the overall performance of participating laboratories. A problem identified in this round involves the systematic underestimation by many laboratories of values of HREEs and associated elements that tend to be hosted by refractory minerals. Special handling of skewed data distributions was necessary to obtain realistic consensus values.

Introduction

This thirty-first round of the international proficiency testing programme, GeoPT, was conducted in a similar manner to earlier rounds. The programme is designed to be part of the routine quality assurance procedures employed by analytical geochemistry laboratories. The programme is organised by the International Association of Geoanalysts and is conducted in

accordance with a published protocol available at (<http://www.geoanalyst.org/documents/GeoPT-protocol.pdf>). The overall aim of the programme is to provide participating laboratories with *z*-score information for each reported elemental determination, from which a laboratory can decide whether the quality of their data is satisfactory in relation both to their chosen fitness-for-purpose criteria and the results submitted by other contributing laboratories and can choose to take corrective action if this appears justified.

Steering Committee for Round 31: P.C. Webb (results coordinator), M. Thompson (statistical advisor), P.J. Potts (analytical advisor), S. Wilson (provision of SdAR-1).

Timetable for Round 31:

Distribution of sample: March 2012.

Deadline for submission of analytical results:

15th June 2012.

Distribution of draft report: July-August 2012.

Sample details

GeoPT31: SdAR-1 is a river sediment with a modified composition designed as an environmental monitoring quality control sample and produced by the U.S.

Geological Survey under direction of Dr S. Wilson. The material was tested by the originating laboratory for suitable grain size distribution and compositional homogeneity, and as a result, was considered suitable for use in the GeoPT proficiency testing programme.

Submission of results

The results submitted for GeoPT31 (SdAR-1) by 89 laboratories are listed in Table 1. All of these data were used for the assessment of the respective assigned values. Two additional sets of data were submitted late.

Assigned values

Following procedures described in earlier rounds, a robust statistical procedure was used to derive assigned concentration values [X_a], these being judged to be the best estimates of the true composition of this sample. Values were assigned on the basis that: (i) sufficient laboratories had contributed data for an element, (ii) the statistical assessment gave confidence that the results distribution showed a central portion approximating to a normal distribution. Part of this assessment involved examining a bar chart of contributed data for each element to judge the distribution of results.

In this round it was soon apparent when processing the contributed results that datasets for some elements did not conform overall to a normal distribution. In particular, there was a large step in the ‘tail’ of the distribution of ordered Zr values at low concentrations (Figure 1). An investigation of the procedures used in

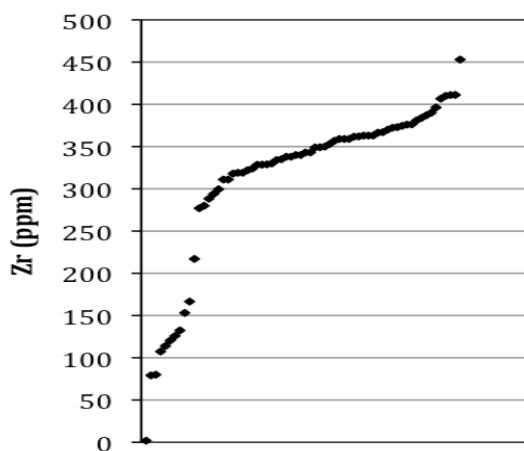

Figure 1. Zr determinations in ascending order for GeoPT31, SdAR-1.

these determinations revealed that almost all of the low values involved sample preparation by acid digestion. Similar patterns were also developed for REEs, especially HREEs, more determinations of which involved sample preparation by acid digestion, whereas

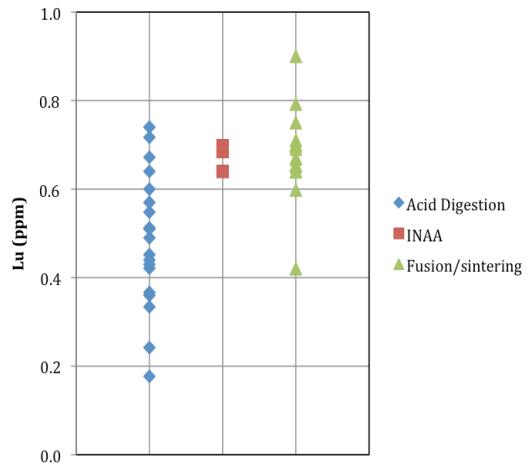

Figure 2. Breakdown of contributed Lu data by analytical technique.

some of the Zr results were obtained by XRF analysis of solid samples. A review of results in relation to procedures used revealed for many of the HREEs that acid digestion gave on average lower values than other forms of analysis (e.g. Figure 2, based on Lu). As a result, data distributions for many HREEs appear bimodal (e.g. Tm, Figure 3).

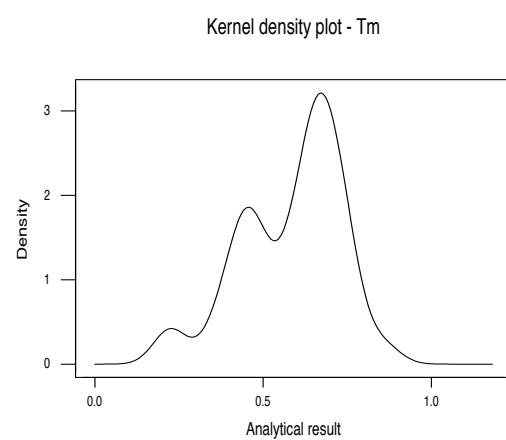

Figure 3. Kernel Density plot showing bimodality of Tm contributed data.

Principal component analysis (PCA) of REE data from laboratories that analysed all REEs revealed a spread of results (Figure 4) in a scatterplot of the first two

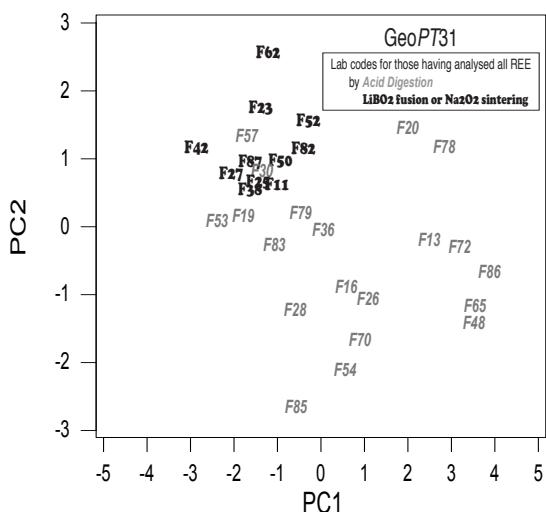

Figure 4. Principal component analysis of REE determinations on GeoPT31, SdAR-1. Sample preparation distinguished by font type.

principal component scores. Identifying sample preparation procedures shows that the tightly defined cluster (bold font) largely represents laboratories performing LiBO₂ fusions or Na₂O₂ sintering as the sample preparation procedure for their ICP-MS or ICP-OES (few) determinations. Laboratories performing acid digestion (faint italic font) form a much more diffuse cluster across the plot, but a few results overlap the cluster representing the fusion or sintering results. We regard this as further evidence for a problem with dissolution affecting many of the REE determinations, and suggests that many laboratories using acid digestion suffer variable degrees of incomplete digestion of refractory minerals, such as zircons, that tend to host REEs, and are likely to be present in the sample on account of its relatively high Zr content.

In view of the consequent bias in many datasets, the usual procedure of taking a robust mean, even a median, to derive an assigned value in these cases would produce unsatisfactory results. The ‘true’ value could be obtained only by complete dissolution, most effectively achieved in this case by fusion or sintering. However, it would be impractical at short notice to separate out datasets according to technique before running the statistical analysis. Indeed, a small number of laboratories performing acid digestions produced results compatible with the fusions. It was noticeable that a substantial number of results derived by fusion or

sintering appeared to produce a ‘flatter’ zone on most of the graphs showing ordered values. This more regular feature in the data distributions often corresponds to a mode in the dataset. Consequently we have fitted modes to achieve consensus values for Dy, Er, Ho, La, Lu, Tb, Tm, Y, Yb and Zr. The procedure used to determine the mode was based on the analysis of mixed populations detailed in Thompson (2006). Although modes have featured in the evaluation of GeoPT consensus values since round 23 for certain unusual data distributions, it has never been necessary to this extent. In view of the exceptional circumstances and, in effect, the use of a reduced dataset to derive a consensus value the resulting values are given provisional status.

GeoPT31 values

Table 2 lists assigned and provisional values for 11 major components and 46 trace elements in GeoPT31 (SdAR-1). Bar charts for the 57 elements/components of GeoPT31 that were judged to have satisfactory distributions for consensus values to be assigned, or provisional values given, are shown in Figure 5, namely: SiO₂, TiO₂, Al₂O₃, Fe₂O₃T, MnO, MgO, CaO, Na₂O, K₂O, P₂O₅, LOI*, Ag*, As*, Ba, Be, Bi*, Cd, Ce, Co, Cr, Cs, Cu*, Dy*, Er*, Eu, Ga, Gd, Ge*, Ho*, In*, La*, Li, Lu*, Mo, Nb, Nd, Ni*, Pb, Pr, Rb, Sb, Sc, Sm, Sn*, Sr, Ta, Tb*, Th, Tl, Tm*, U, V, W*, Y*, Yb*, Zn and Zr*. Of these, only provisional values could be given to the 20 marked ‘*’: this is an unusually large number, in large part for the reasons discussed above. Other instances of provisional status were recognised because either a relatively small number of measurements contributed to the consensus (Ge and In), or the degree of dispersion of the data was relatively high (LOI, Ag, As, Bi, Cu and Ni).

In 25 cases the robust mean was used to define the consensus value and in 20 cases the median value was preferred. In 12 cases the most satisfactory consensus value was provided by a mode, in many cases (HREEs, La, Y, Zr) for the reasons discussed above. Most values obtained in this way were designated provisional values.

Bar charts for the 12 elements/components: Fe(II)O, H₂O⁺, CO₂, Au, C(tot), C(org), Cl, F, Hf, Hg, S, Se and Te are plotted in Figure 6 for information only, as the data were insufficient or too variable for the reliable determination of a consensus.

Bar charts for most major elements showed well-behaved distributions of results with a central portion approximating to a normal distribution. However, as noted in past rounds several distributions (Figure 5.1) had the appearance of multimodality, largely on account of truncation of data reported at low concentrations: this applies especially to TiO₂, MgO, CaO and P₂O₅.

Z-score analysis

As in previous rounds, laboratories were invited to choose one of two performance standards against which their analytical results would be judged:

Data quality 1 for laboratories working to a 'pure geochemistry' standard of performance, where analytical results are designed for geochemical research and where care is taken to provide data of high precision and accuracy, sometimes at the expense of a reduced sample throughput rate. For GeoPT31, 1671 results of data quality 1 were submitted.

Data quality 2 for laboratories working to an 'applied geochemistry' standard of performance, where, although precision and accuracy are still important, the main objective is to provide results on large numbers of samples collected, for example, as part of geochemical mapping projects or geochemical exploration programmes. For GeoPT31, 1609 results of data quality 2 were submitted.

The target standard deviation (H_a) for each element assessed was calculated from a modified form of the Horwitz function as follows:

$$H_a = k \cdot X_a^{0.8495}$$

Where X_a is the concentration of the element expressed as a *fraction*, and the factor $k = 0.01$ for pure geochemistry laboratories and $k=0.02$ for applied geochemistry laboratories.

Z-scores were calculated for each elemental result submitted by each laboratory from:

$$z = [X - X_a] / H_a$$

where: X is the contributed result, X_a is the assigned value and H_a is the target standard deviation.

Z-score results for contributors to GeoPT31 are listed in Table 3. Participating laboratories are invited to assess their performance using the following criterion:-

Z-score results in the range $-2 < z < 2$ are considered to be 'satisfactory' (in the sense that no action is called for by the participant). If the z -score for any element falls outside this range, especially if it is outside the range $-3 < z < 3$, it would be advisable for the contributing laboratory to examine its procedures, and if necessary, take action to ensure that determinations are not subject to unsuspected analytical bias.

Overall performance

A summary of the overall performance of individual laboratories in this round is plotted in multiple z -score charts for GeoPT31 in Figure 7. In these charts, the z -score performance for each element is distinguished by symbols that make it simple to identify whether the results were satisfactory or gave z -scores that exceeded the action limits. This chart is designed to help individual laboratories to judge their overall performance in this proficiency testing round.

It should be noted that there is strong evidence for problems with the results produced by many laboratories engaged in acid digestion procedures, which in general did not perform well for this particular sample. The reason(s) for values of HREEs and associated elements being underestimated is thought to be incomplete dissolution of refractory minerals. Further work to discover why this sample proved to be problematic and why procedures of many laboratories appear to be unprepared for such a sample will be carried out and published separately.

Participants are reminded that they should always review their *z*-scores in accord with their own fitness-for-purpose criteria.

Participation in future rounds

The benefit from proficiency testing arises from regular participation and laboratories are invited to contribute to the GeoPT32 round, the sample for which will be distributed during September 2012.

Acknowledgements

The authors thank Liz Lomas (OU) for valued assistance in distributing both the sample and the report, and John Watson (OU) for assistance with repackaging some of the SdAR-1 samples.

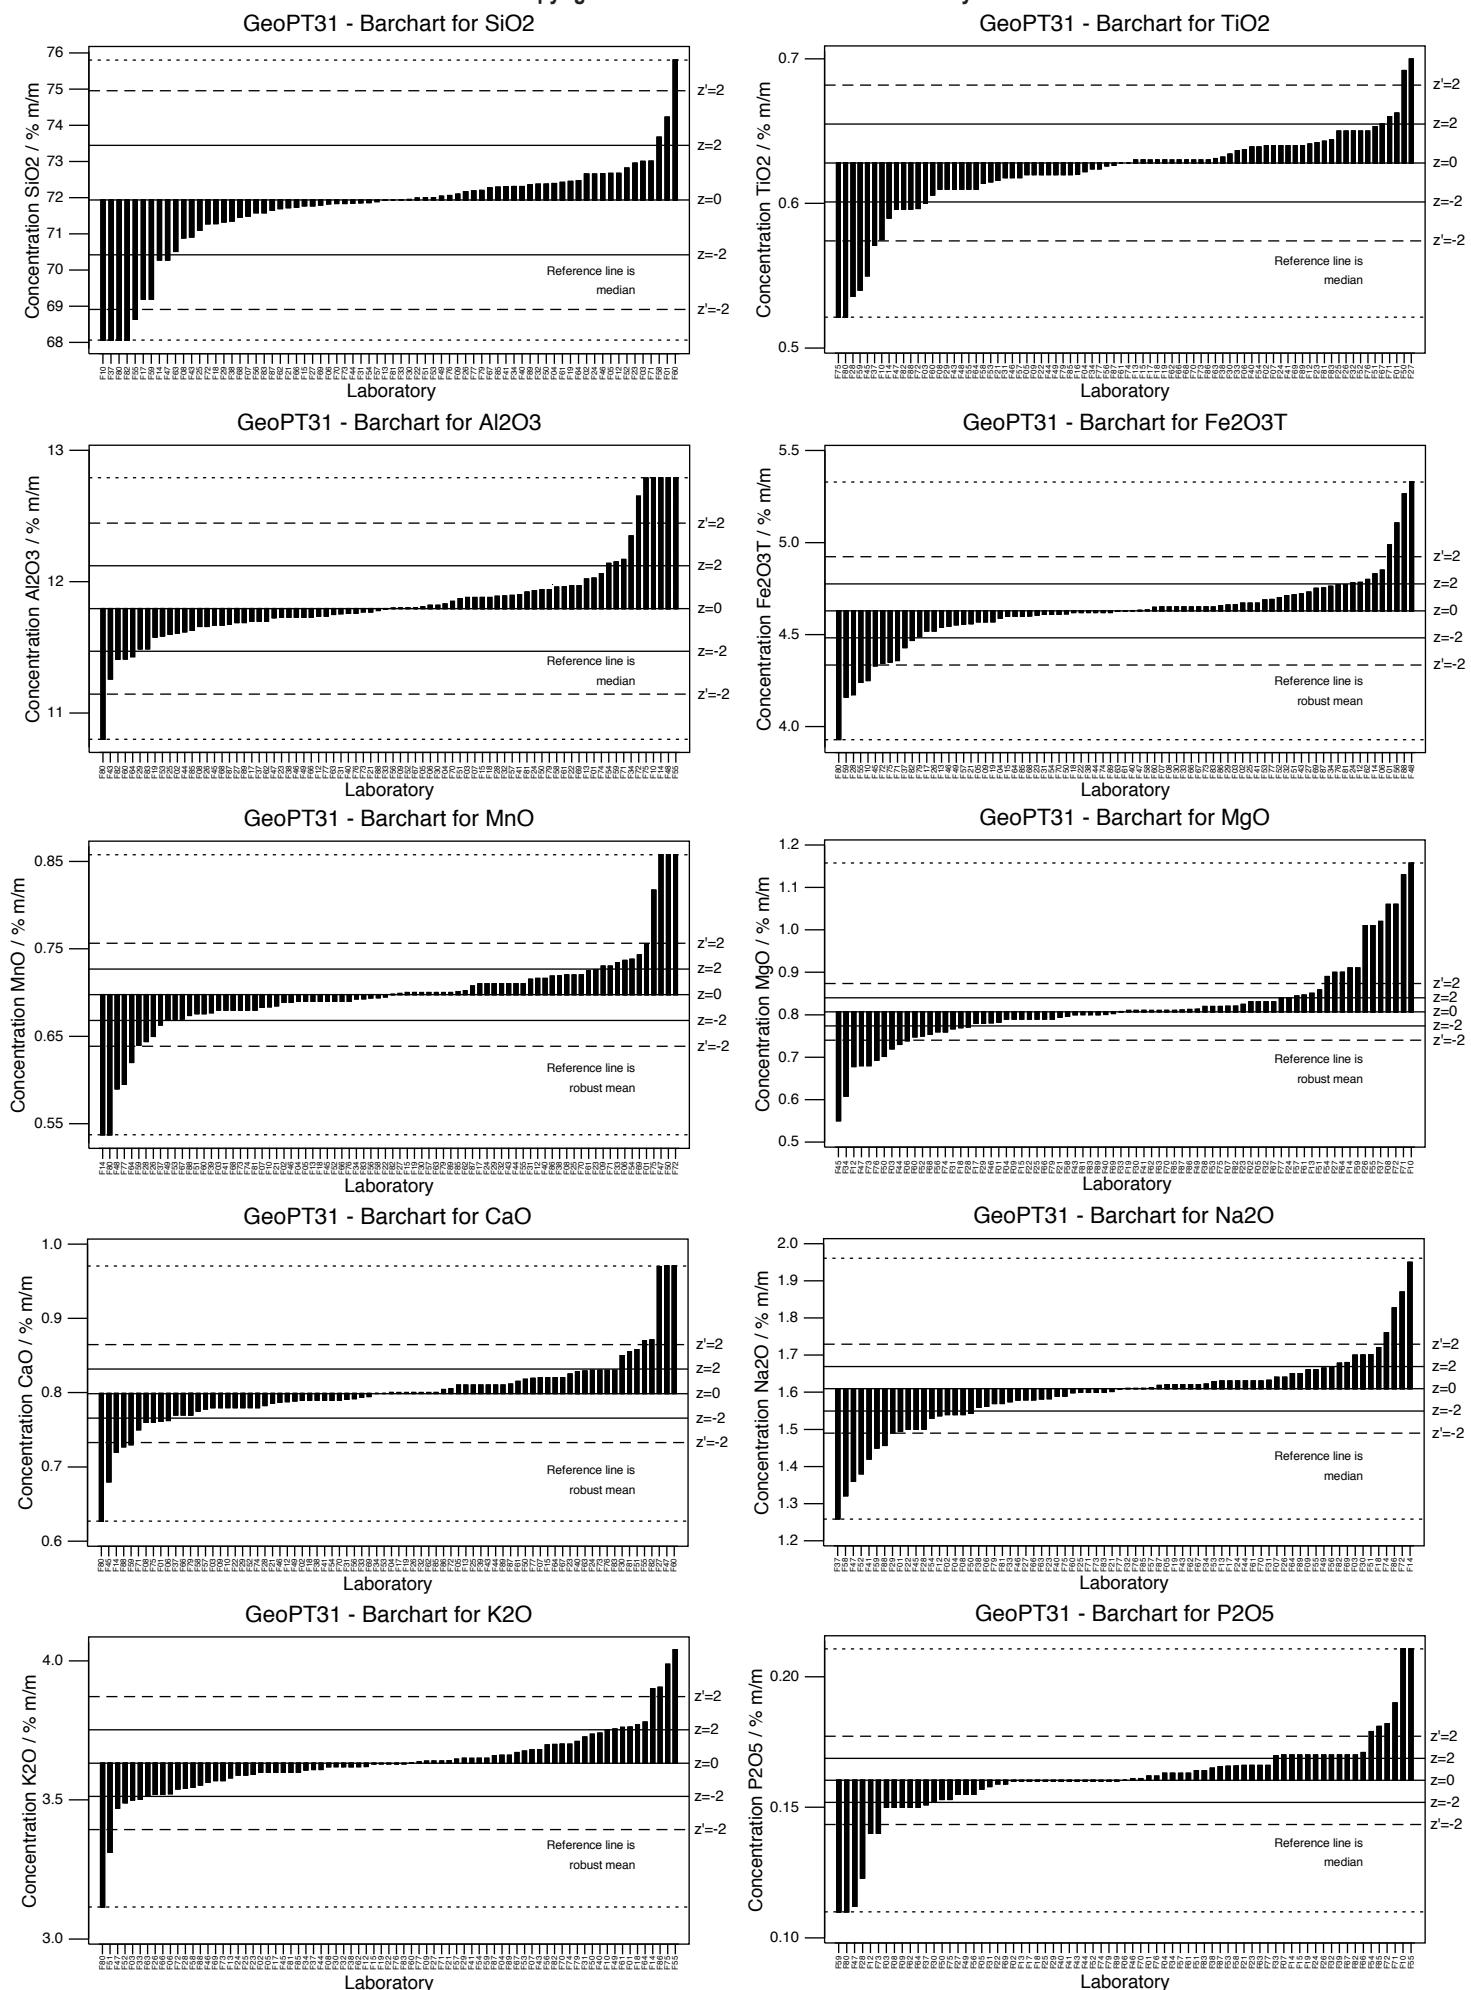

Figure 5.1: GeoPT31, SdAR-1, modified river sediment. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

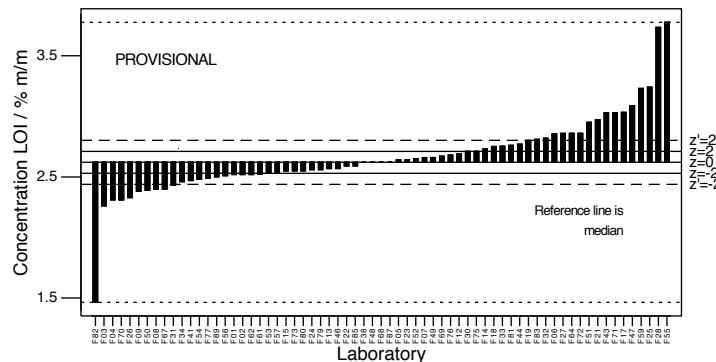

Figure 5.1 (cont'd): GeoPT31 – SdAR-1, modified river sediment. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

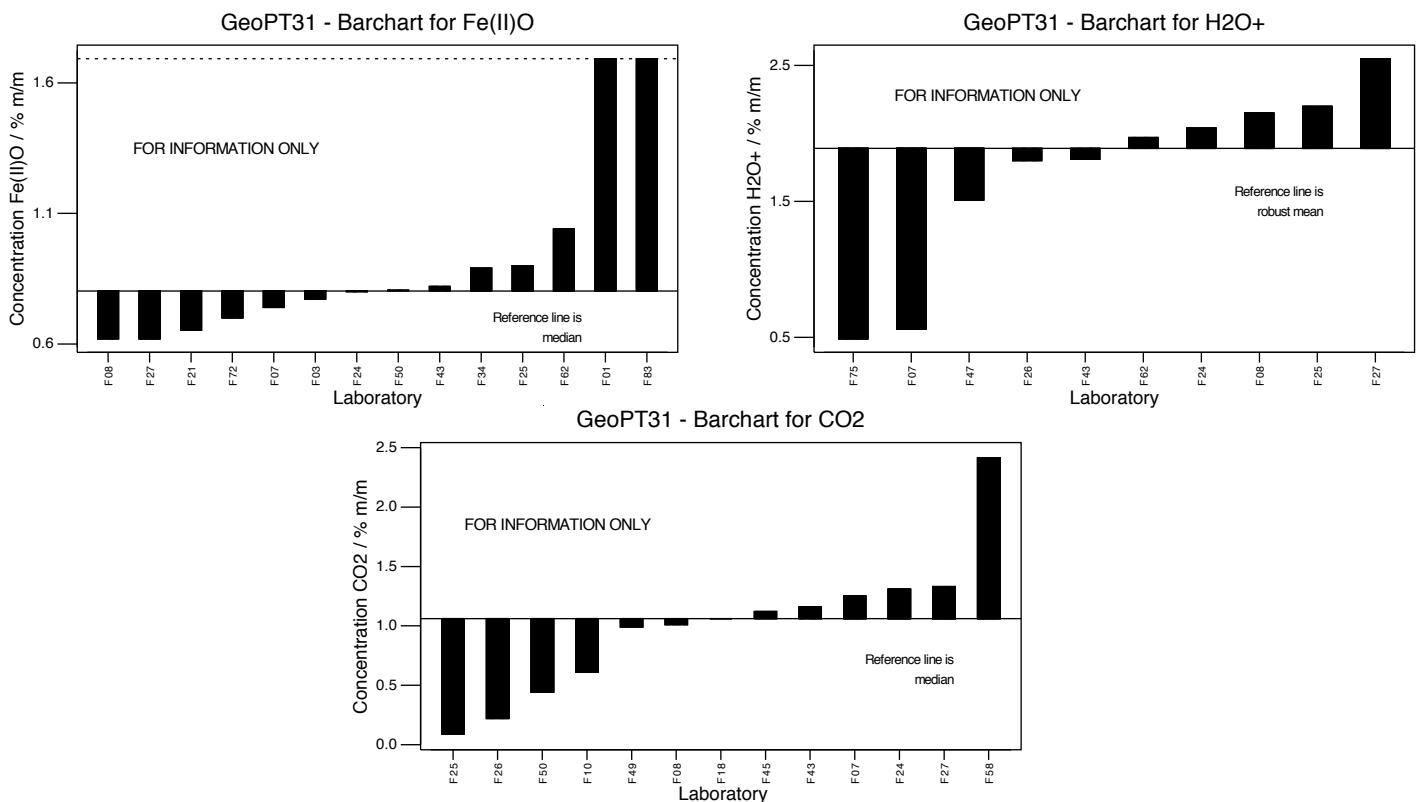

Figure 6.1: GeoPT31 – SdAR-1, modified river sediment. Data distribution charts for information only for elements for which values could not be assigned.

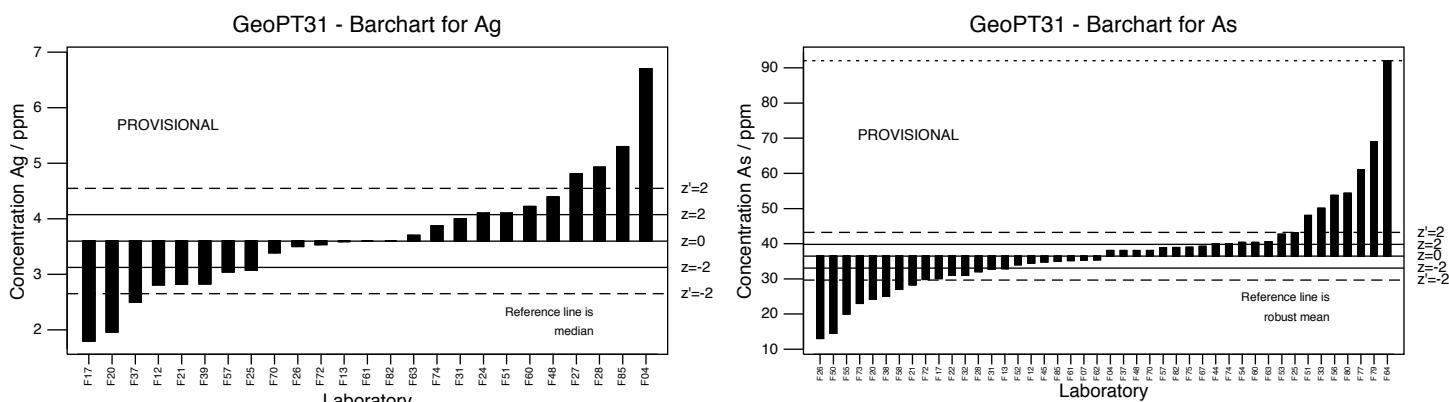

Figure 5.2: GeoPT31 – SdAR-1, modified river sediment. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

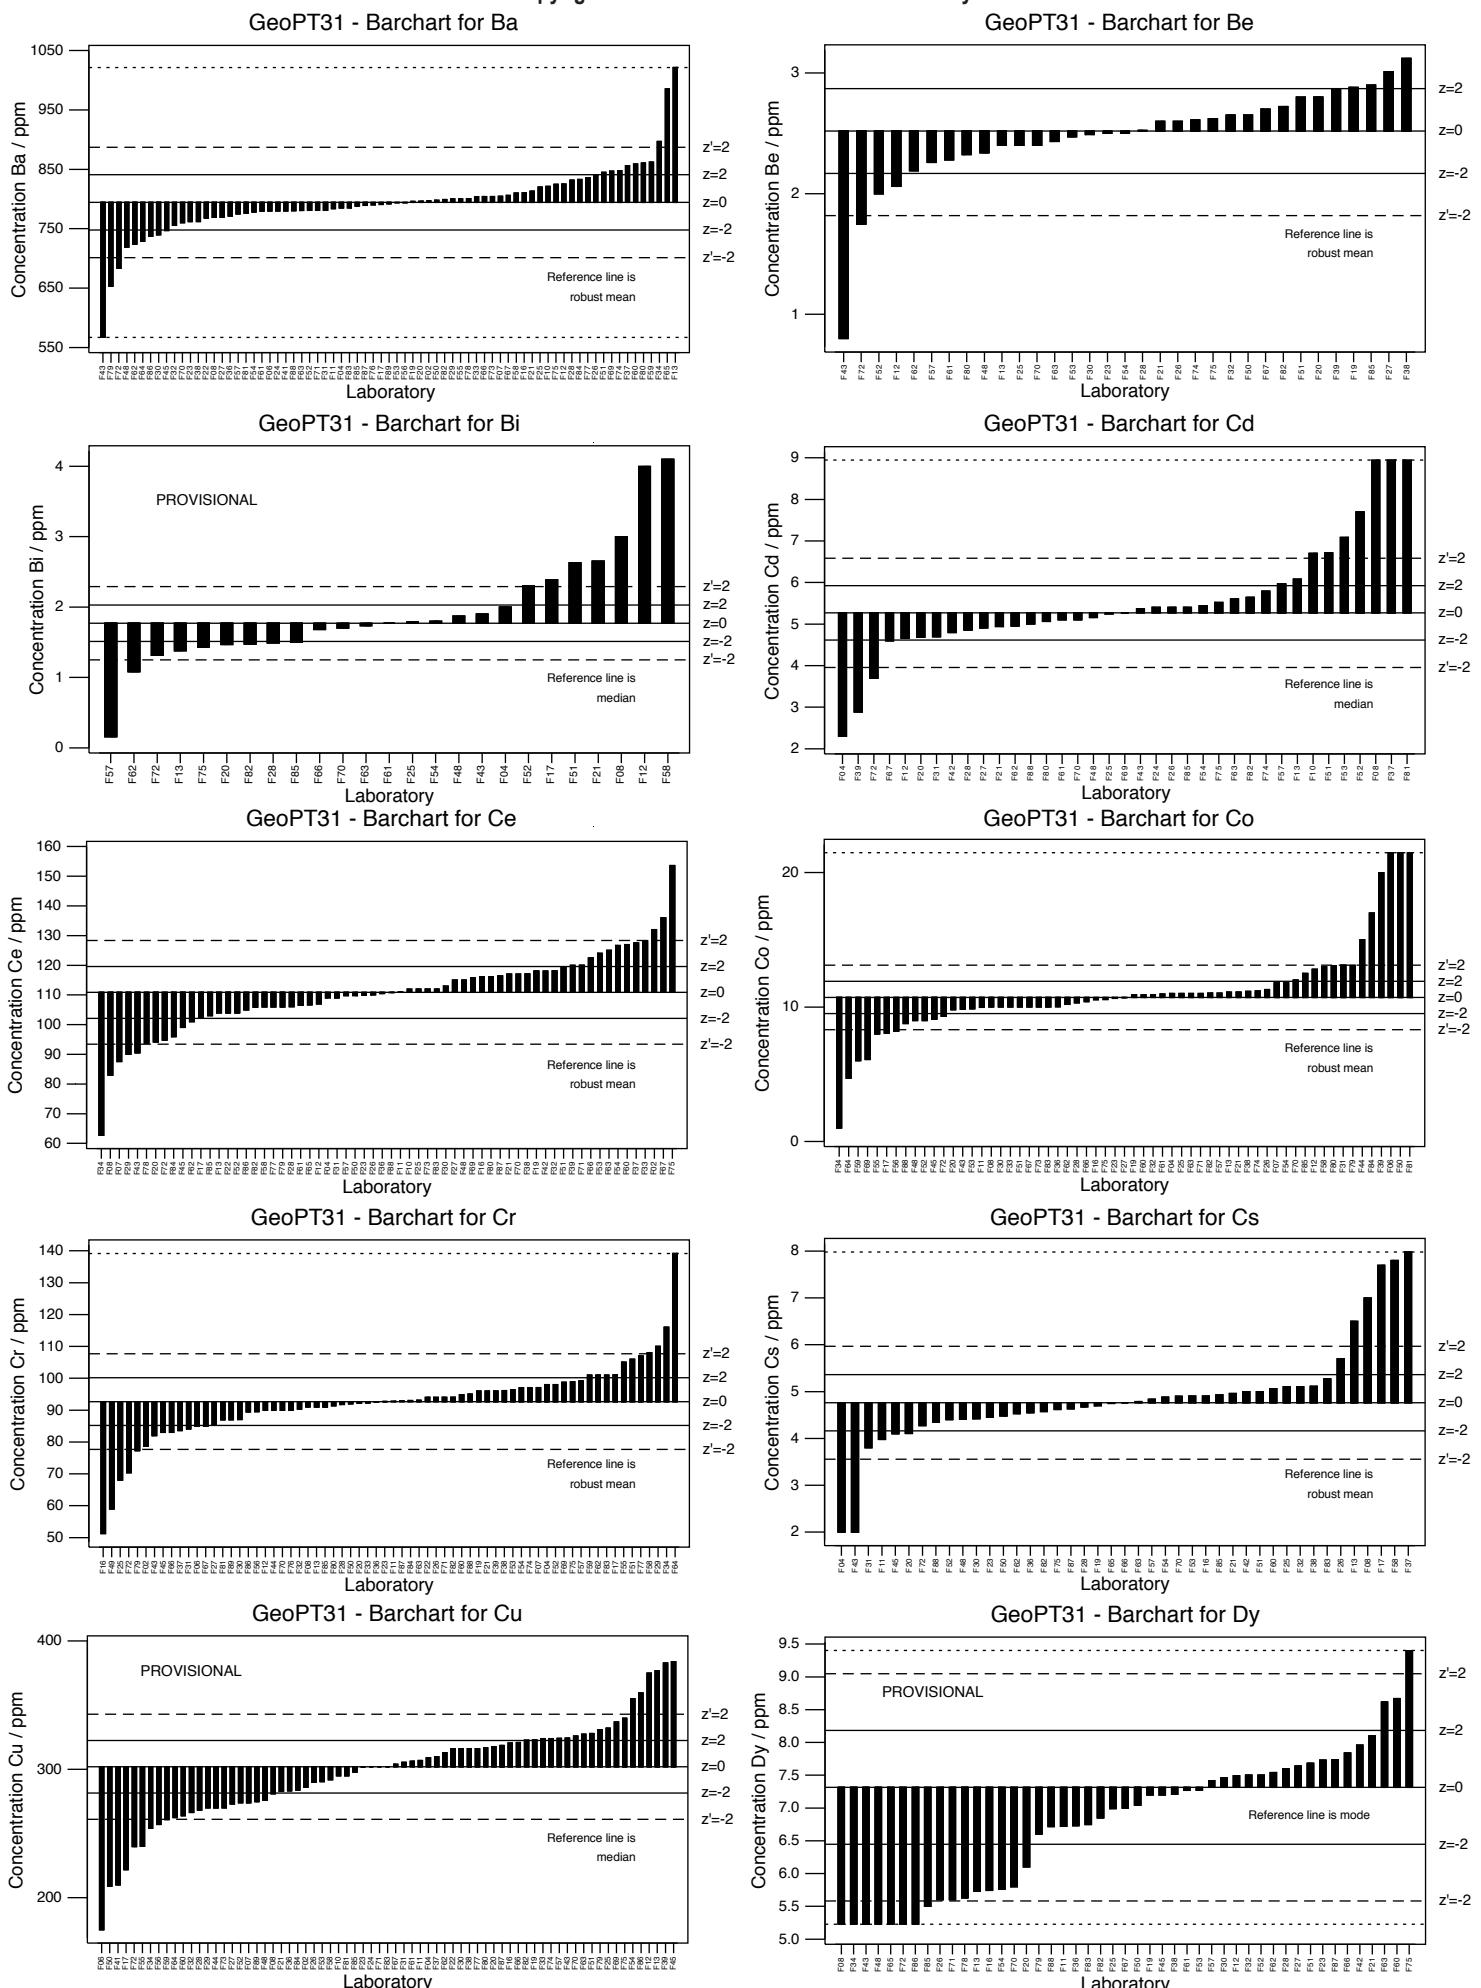

Figure 5.2 (cont'd): GeoPT31, SdAR-1, modified river sediment. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

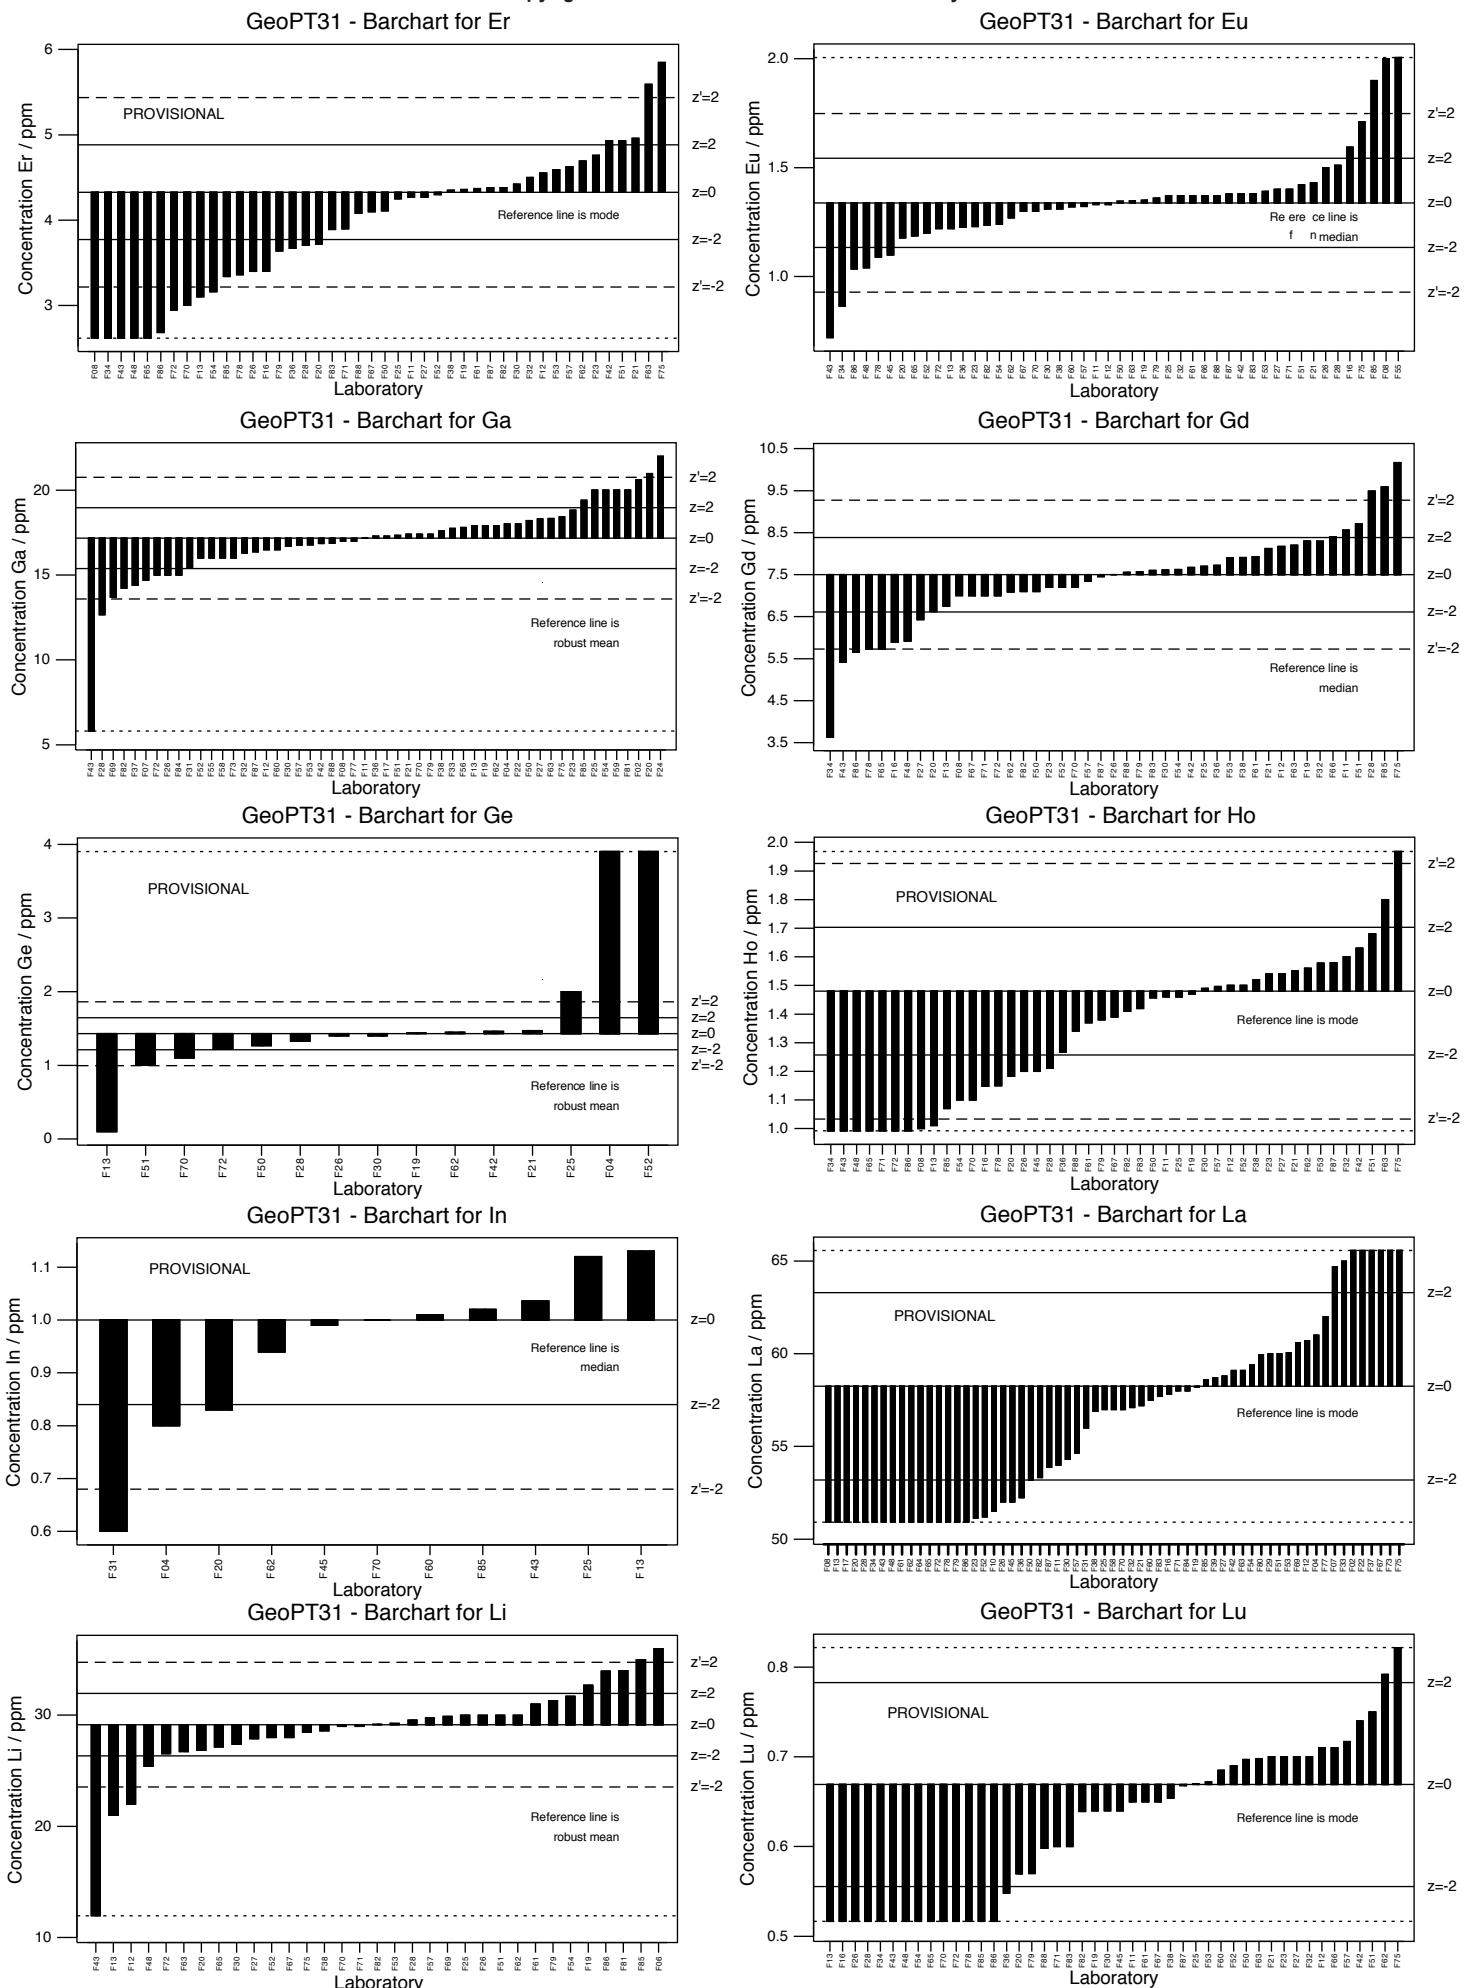

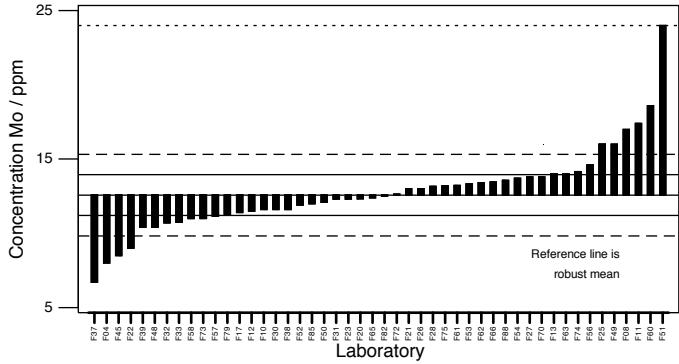

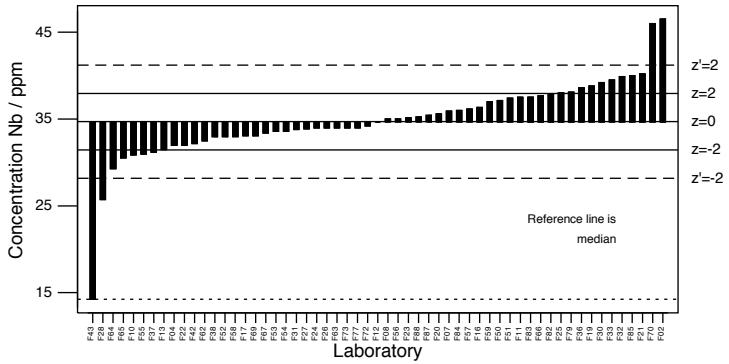

Figure 5.2 (cont'd): GeoPT31, SdAR-1, modified river sediment. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z' < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z' < 2$ for applied geochemistry labs (pecked lines).

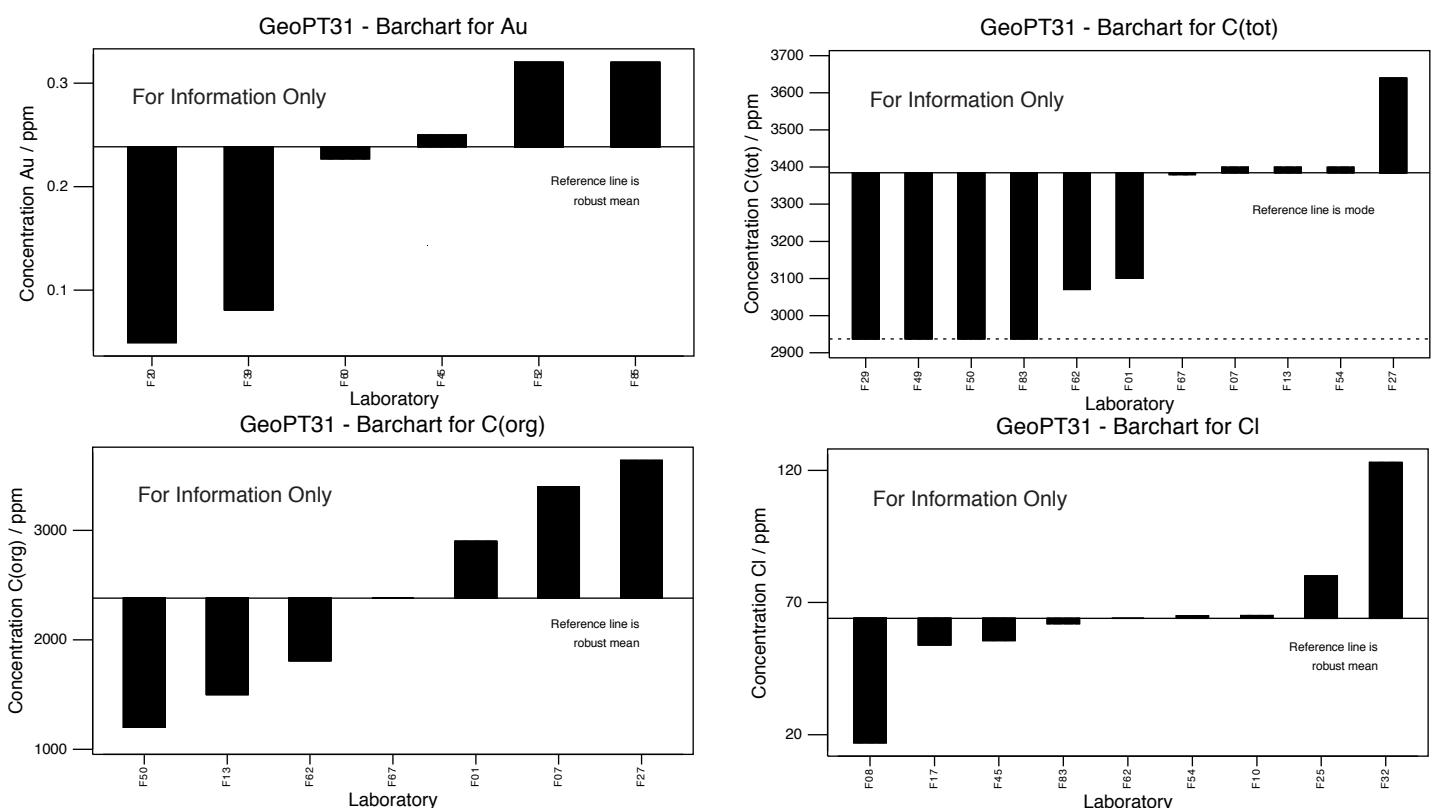

Figure 6.2: GeoPT31 – SdAR-1, modified river sediment. Data distribution charts for information only for elements for which values could not be assigned.

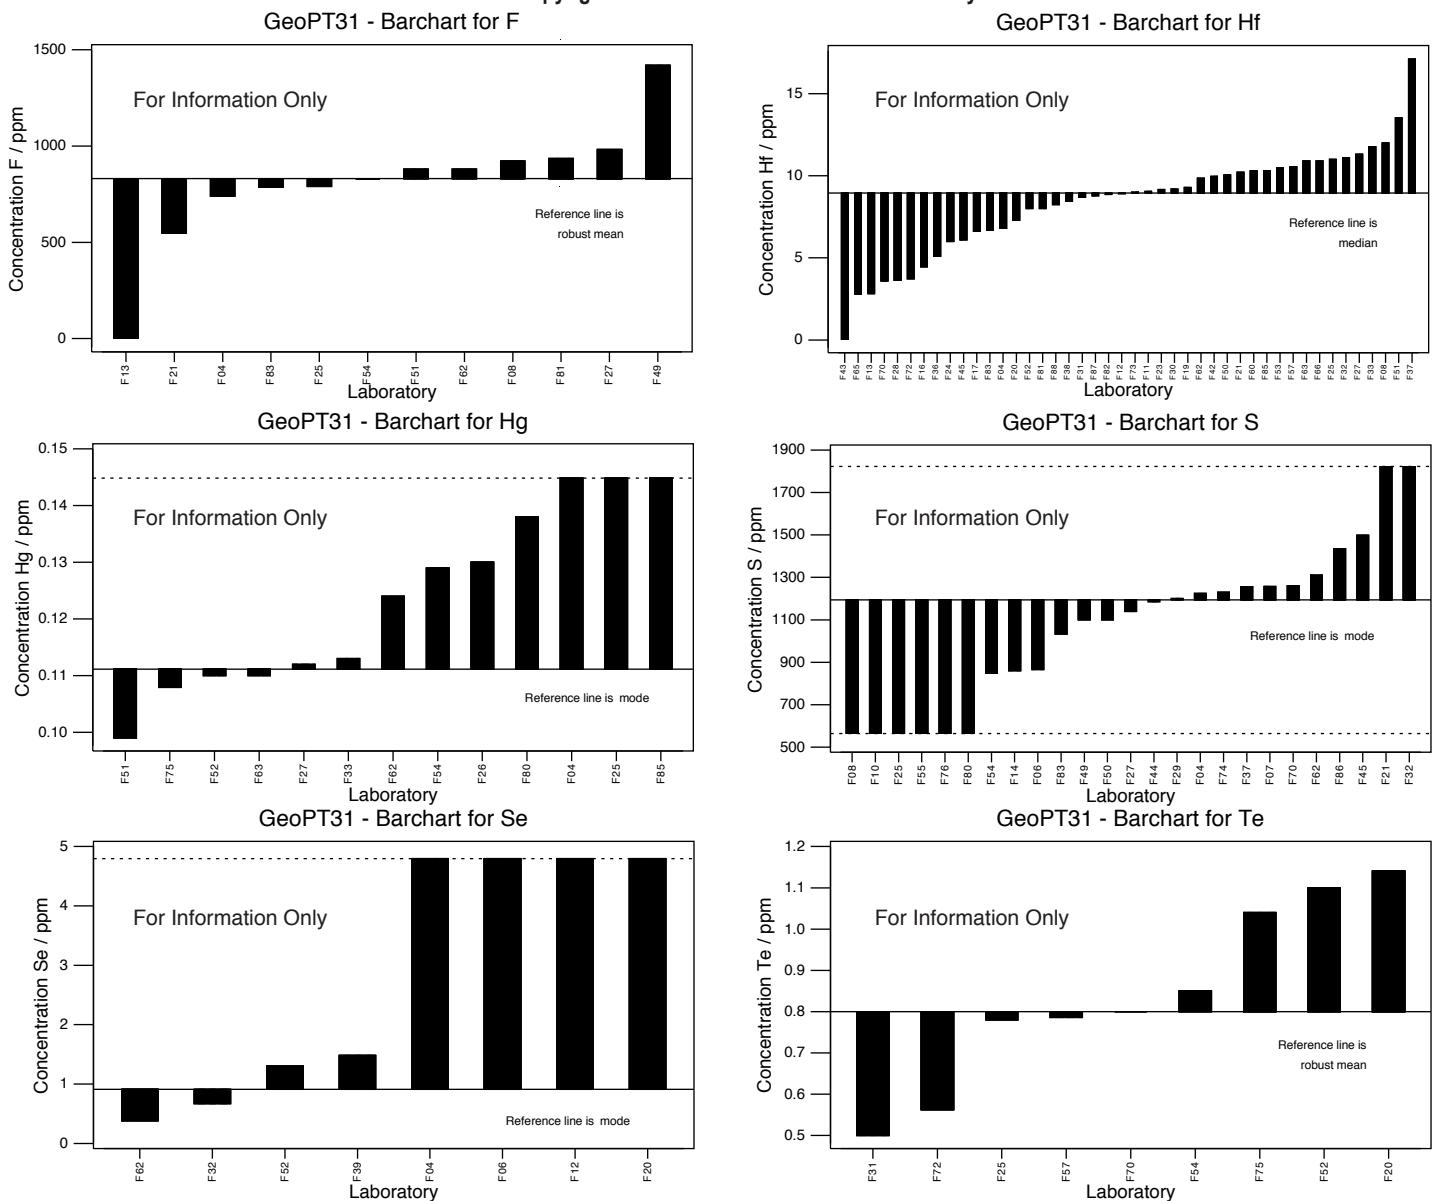

Figure 6.2 (cont'd): GeoPT31, SdAR-1, modified river sediment. Data distribution charts for information only for elements for which values could not be assigned.

Multiple z-score chart for GeoPT31

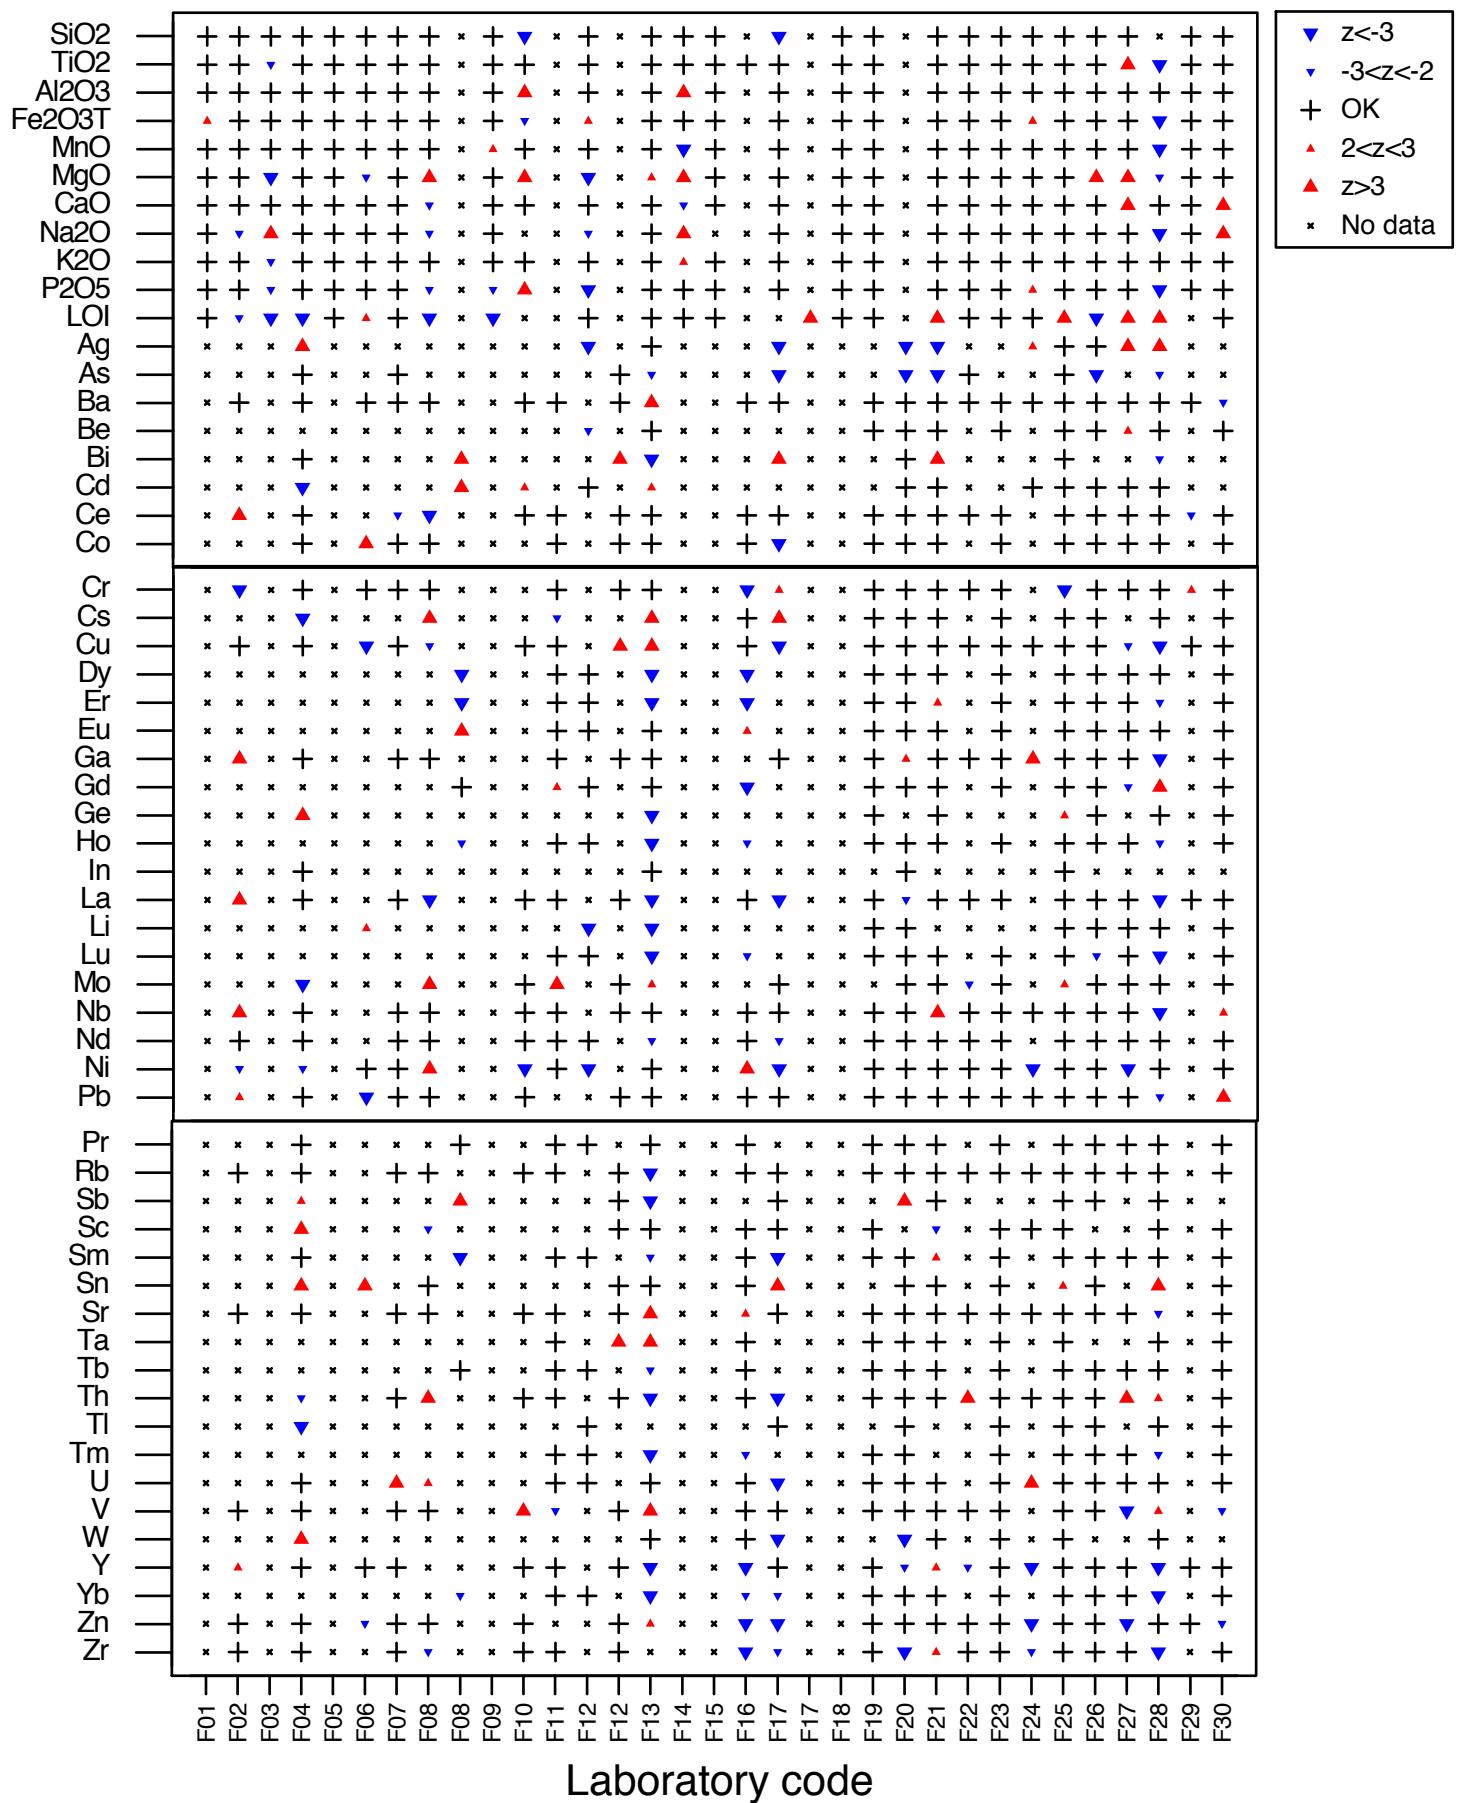

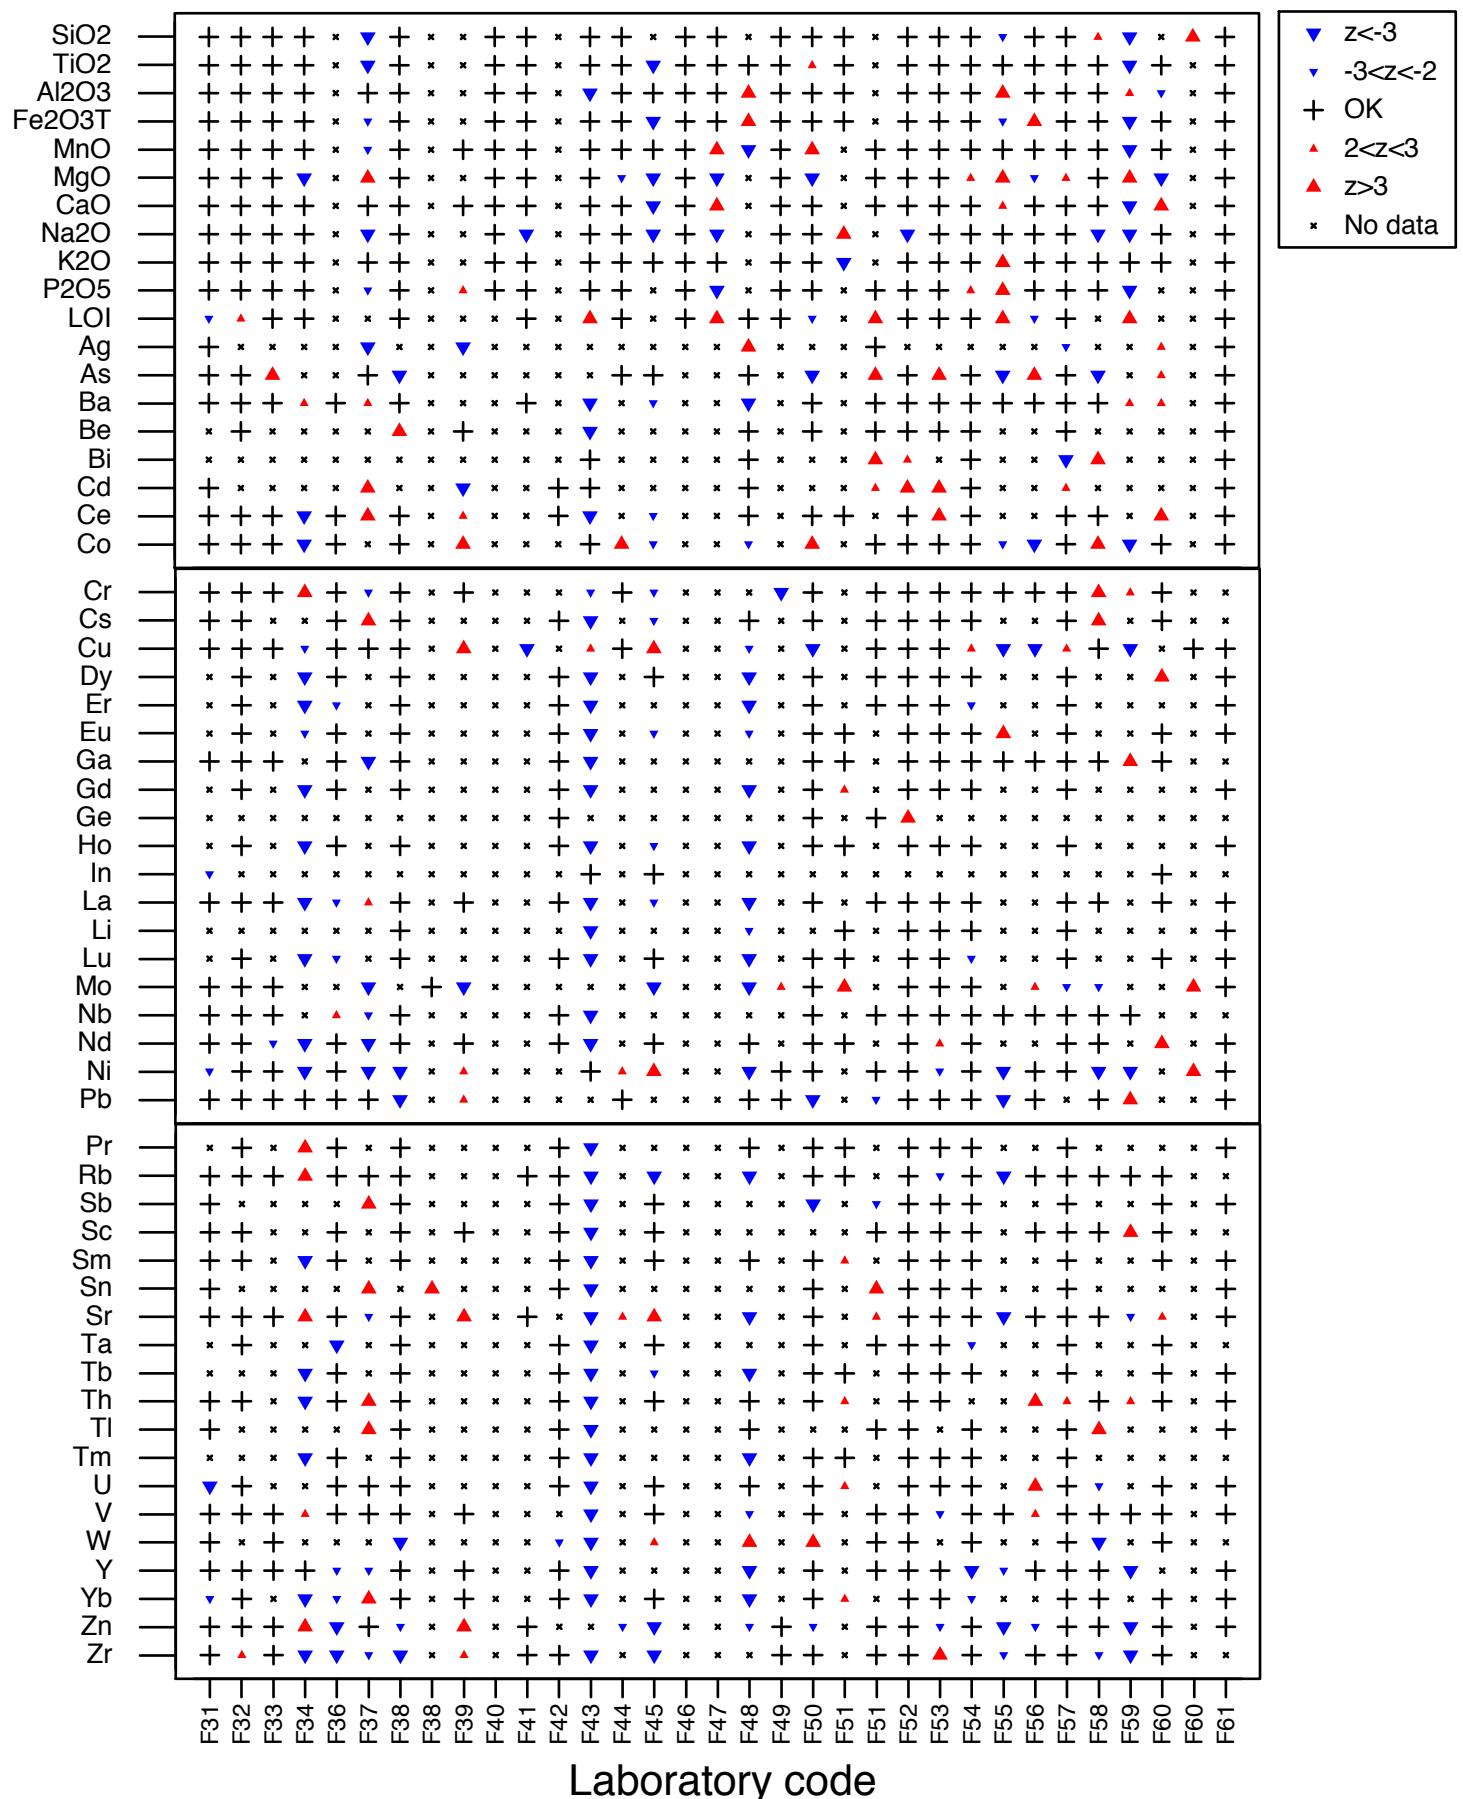

Figure 7.1: GeoPT31 – Modified river sediment, SdAR-1. Multiple z-score charts for laboratories participating in the GeoPT31 round. Symbols indicate whether or not an elemental result complies with the $-2 < z < +2$ criteria. Satisfactory data are plotted as '+'. Data for other categories are plotted as follows: $z < -3$ (\blacktriangledown), $-3 < z < -2$ (\blacktriangleright), $+2 < z < +3$ (\blacktriangle), $z > +3$ (\blacktriangleleft).

Multiple z-score chart for GeoPT31

Laboratory code

Figure 7.2: GeoPT31 – Modified river sediment, SdAR-1. Multiple z-score charts for laboratories participating in the GeoPT31 round. Symbols indicate whether or not an elemental result complies with the $-2 < z < +2$ criteria. Satisfactory data are plotted as '+'. Data for other categories are plotted as follows: $z < -3$ (▼), $-3 < z < -2$ (▽), $+2 < z < +3$ (▲), $z > +3$ (▲).

Multiple z-score chart for GeoPT31

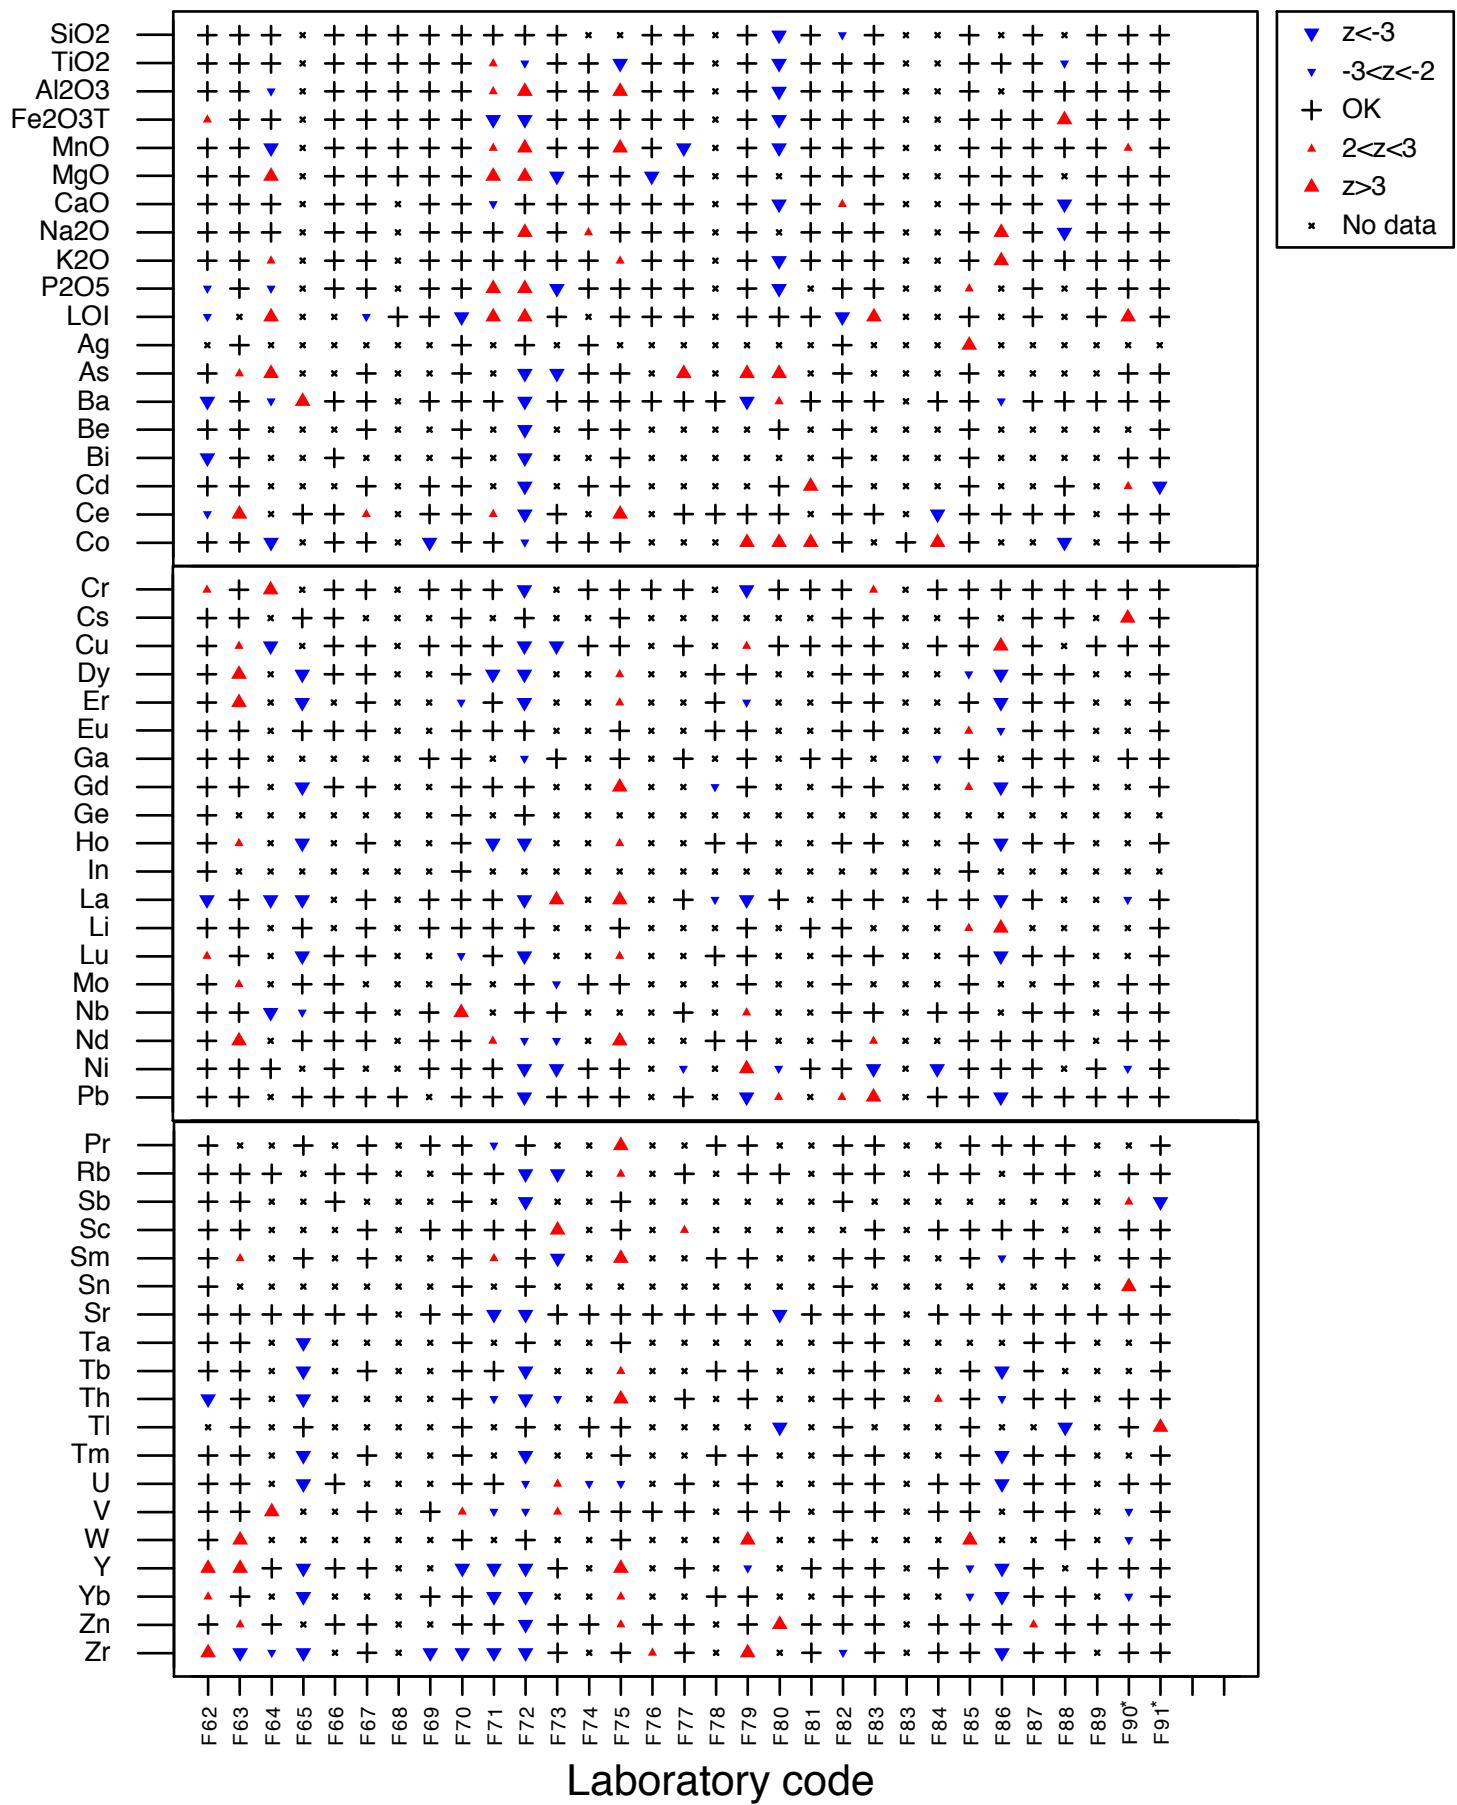

Figure 7.3: GeoPT31 – Modified river sediment, SdAR-1. Multiple z-score charts for laboratories participating in the GeoPT31 round. Symbols indicate whether or not an elemental result complies with the $-2 < z < +2$ criteria. Satisfactory data are plotted as '+'. Data for other categories are plotted as follows: $z < -3$ (\blacktriangledown), $-3 < z < -2$ (\blacktriangledown), $+2 < z < +3$ (\blacktriangle), $z > +3$ (\blacktriangle).
