## **Abstract**

Results are presented for GeoPT33, the subject of round thirty-three of the International Association of Geoanalysts' Proficiency Testing programme for analytical geochemistry laboratories. The test sample distributed in this round is a ball clay, DBC-1, prepared by Sibelco Europe under the direction of Bartek Prusisz and Kevin Young. In this report, the data contributed from 89 laboratories are listed, together with an assessment of consensus values, consequent *z*-scores and charts to show the distribution of contributed results and the overall performance of participating laboratories.

## **Introduction**

This thirty-third round of the international proficiency testing programme, GeoPT, was conducted in a similar manner to earlier rounds. The programme is designed to be part of the routine quality assurance procedures employed by analytical geochemistry laboratories. The programme is organised by the International Association of Geoanalysts and is conducted in accordance with a published protocol available at (<http://www.geoanalyst.org/documents/GeoPT-protocol.pdf>). The overall aim of the programme is to

provide participating laboratories with *z*-score information for reported elemental determinations from which the laboratory can decide whether the quality of their data is satisfactory in relation both to their chosen fitness-for-purpose criteria and to the results submitted by other laboratories contributing to the round and can choose to take corrective action if this appears justified.

**Steering Committee for Round 33:** P.C. Webb (results coordinator), M. Thompson (statistical advisor), P.J. Potts (analytical advisor), B. Prusisz and K. Young (provision of DBC-1).

## **Timetable for Round 33:**

Distribution of sample: March 2013.

Deadline for submission of analytical results:  
14th June 2013.

Distribution of draft report: August 2013

## **Sample details**

**GeoPT33:** The ball clay test material, DBC-1, was produced by Sibelco Europe under the direction of Bartek Prusisz and Kevin Young. The test material was evaluated for homogeneity by XRF analysis at the Open

University and as a result, the sample was considered suitable for use in this proficiency test.

### Submission of results

The results submitted for GeoPT33 (DBC-1) by 89 laboratories are listed in Table 1. All of these data were used to assess respective assigned values. Three additional sets of data were submitted late.

### Assigned values

Following procedures described in earlier rounds, a robust statistical procedure was used to derive assigned concentration values [ $X_a$ ], these being judged to be the best estimates of the true composition of this sample. Values were assigned on the basis that: (i) sufficient laboratories had contributed data for an element, and (ii) the statistical assessment gave confidence that the results distribution showed a central portion approximating to a normal distribution. Part of this assessment involved examining a bar chart of contributed data for each element to judge the distribution of results.

In this round it was apparent that there was confusion about what  $H_2O^+$  represents. Five laboratories reported values of 1-2%, and eight reported values between 8 and 10.5 %. As noted in the Instructions to Analysts, point 7(ii),  $H_2O^+$  is the ‘structural’ water contained in minerals and remaining *after* drying. Therefore  $H_2O^+$  is the loss of mass between the dried state (105°C) and the ignited state (ca. 1000°C), not the loss *during* drying, which is  $H_2O^-$  (not required by GeoPT).

Table 2 lists assigned and provisional values for 10 major components and 47 trace elements in GeoPT33 (DBC-1). Bar charts for the 57 elements/components of GeoPT33 that were judged to have satisfactory distributions for consensus values to be assigned or provisional values to be given are shown in Figure 1.1 and 1.2. These are:  $SiO_2$ ,  $TiO_2$ ,  $Al_2O_3$ ,  $Fe_2O_3T$ ,  $MgO$ ,  $CaO^*$ ,  $Na_2O^*$ ,  $K_2O$ ,  $P_2O_5$ , LOI\*, As\*, Ba, Be, Bi\*, C(tot)\*, Ce, Co\*, Cr, Cs, Cu\*, Dy, Er\*, Eu, Ga, Gd, Ge\*, Hf, Hg\*, Ho, La, Li, Lu, Mo, Nb, Nd, Ni, Pb, Pr,

Rb, Sb\*, Sc, Se\*, Sm, Sn\*, Sr, Ta, Tb, Th, Tl\*, Tm, U, V, W, Y, Yb, Zn\* and Zr. Of these, only provisional values could be given to the 16 marked ‘\*’. Instances of provisional status were recorded because i) a relatively small number of measurements contributed to the consensus, or ii) the degree of consensus was less than ideal because results were significantly dispersed in relation to the target value or the distribution was in part assymmetrical.

Some major (minor) elements, in particular,  $MnO$ ,  $MgO$ ,  $CaO$ ,  $Na_2O$  and  $P_2O_5$  were at particularly low levels in this sample, giving rise to greater than usual dispersion of data relative to that in many other GeoPT rounds. The essentially symmetrical distributions of  $MgO$ ,  $CaO$ ,  $Na_2O$  and  $P_2O_5$  results allowed values to be assigned or provisionally assigned in the case of  $CaO$  and  $Na_2O$ .

Many REE data distributions exhibited prominent low tails and robust means often appeared biased towards low values. Medians were generally preferred as they gave a more symmetrical distribution of contributed data. The reason for the low tails has yet to be investigated. There are correlations in the apparent deficiencies reported for a range of REEs, but no correlation with Zr. The suspicion is that the bias may be due to incomplete dissolution of a REE-rich mineral or minerals such as monazite in circumstances when acid digestion was used for sample preparation. Monazite is a residual mineral when granite is chemically weathered to produce kaolinite. Ball clay is a water-lain deposit comprising the products of weathering and residual minerals, such as monazite.

There were striking high tails for a number of metals, in particular,  $MnO$ , Bi, Co, Cu, Zn and Cd. Values for some are close to detection limits for XRF analysis, but that should not be the cause for Cu and Zn high tails.

In 28 cases the robust mean was used to define the consensus value but in 24 cases the median value was preferred. In 5 cases a mode provided the most

satisfactory consensus value. The procedure used to determine the mode was based on the analysis of mixed populations detailed in Thompson (2006) and first used for GeoPT23. Values obtained in this way were, in all cases, designated as provisional values. Bar charts for the 12 elements/components: Fe(II)O, MnO, H<sub>2</sub>O<sup>+</sup>, CO<sub>2</sub>, Ag, B, C(org), Cd, F, In, S and Te are plotted in Figure 2.1 and 2.2 for information only, as the data were insufficient or too variable for the reliable determination of a consensus.

### Z-score analysis

As in previous rounds, laboratories were invited to choose one of two performance standards against which their analytical results would be judged:

**Data quality 1** for laboratories working to a 'pure geochemistry' standard of performance, where analytical results are designed for geochemical research and where care is taken to provide data of high precision and accuracy, sometimes at the expense of a reduced sample throughput rate. For GeoPT33, 1614 results of data quality 1 were submitted.

**Data quality 2** for laboratories working to an 'applied geochemistry' standard of performance, where, although precision and accuracy are still important, the main objective is to provide results on large numbers of samples collected, for example, as part of geochemical mapping projects or geochemical exploration programmes. For GeoPT33, 1815 results of data quality 2 were submitted.

The target standard deviation ( $H_a$ ) for each element assessed was calculated from a modified form of the Horwitz function as follows:

$$H_a = k \cdot X_a^{0.8495}$$

Where  $X_a$  is the concentration of the element expressed as a fraction; the factor  $k = 0.01$  for pure geochemistry labs and  $k=0.02$  for applied geochemistry labs.

Z-scores were calculated for each elemental result submitted by each laboratory from:

$$z = [X - X_a] / H_a$$

where:  $X$  is the contributed result,  $X_a$  is the assigned value and  $H_a$  is the target standard deviation.

Z-score results for contributors to GeoPT33 are listed in Table 3. Participating laboratories are invited to assess their performance using the following criterion:-

Z-score results in the range  $-2 < z < 2$  are considered to be 'satisfactory' (in the sense that no action is called for by the participant). If the  $z$ -score for any element falls outside this range, especially if it is outside the range  $-3 < z < 3$ , it would be advisable for the contributing laboratory to examine its procedures, and if necessary, take action to ensure that determinations are not subject to unsuspected analytical bias.

### Overall performance

A summary of the overall performance of individual laboratories in this round is plotted in multiple  $z$ -score charts for GeoPT33 in Figure 3. In these charts, the  $z$ -score performance for each element is distinguished by symbols that make it simple to identify whether the results were satisfactory or gave  $z$ -scores that exceeded the action limits. This chart is designed to help individual laboratories to judge their overall performance in this proficiency testing round.

Participants should always review their  $z$ -scores in accord with their own fitness-for-purpose criteria.

### Participation in future rounds

The benefit from proficiency testing arises from regular participation and laboratories are invited to contribute to the GeoPT34 round, the sample for which will be distributed during September 2013.

### Acknowledgements

The authors thank Liz Lomas for valued assistance in distributing both the sample and the report; Charles Gowing and BGS laboratory staff for dividing the sample; and John Watson for

assistance with labelling and packaging the DBC-1 samples.

Round 33 - Barchart for SiO<sub>2</sub>Round 33 - Barchart for TiO<sub>2</sub>Round 33 - Barchart for Al<sub>2</sub>O<sub>3</sub>

## Round 33 - Barchart for MgO

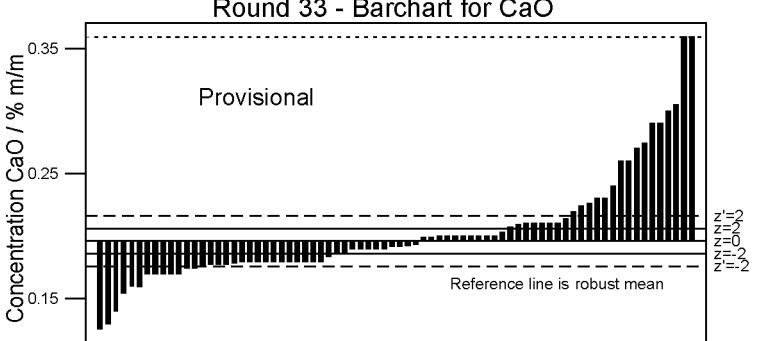

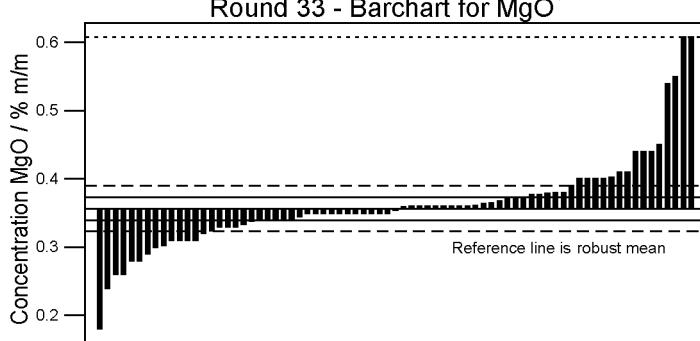

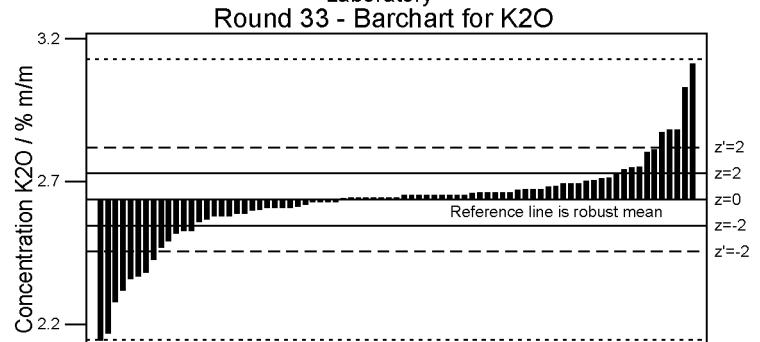

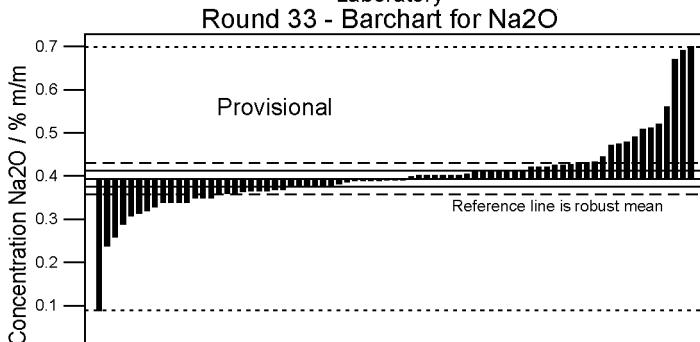

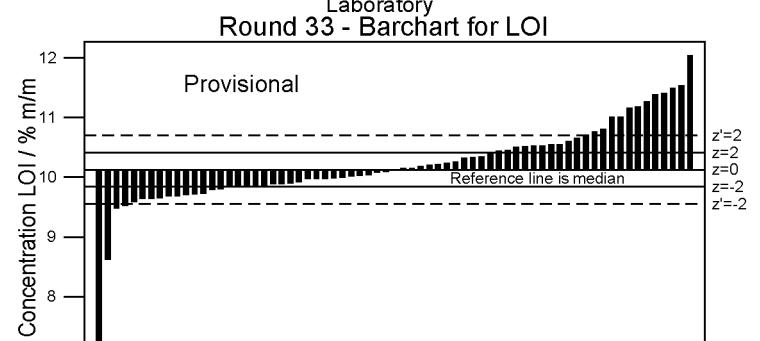

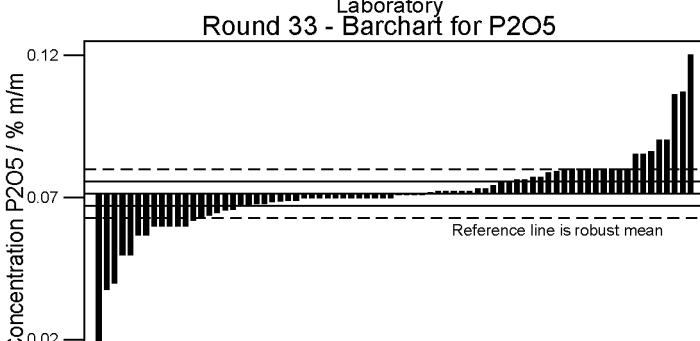

Round 33 - Barchart for Na<sub>2</sub>ORound 33 - Barchart for P<sub>2</sub>O<sub>5</sub>

Figure 1.1: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

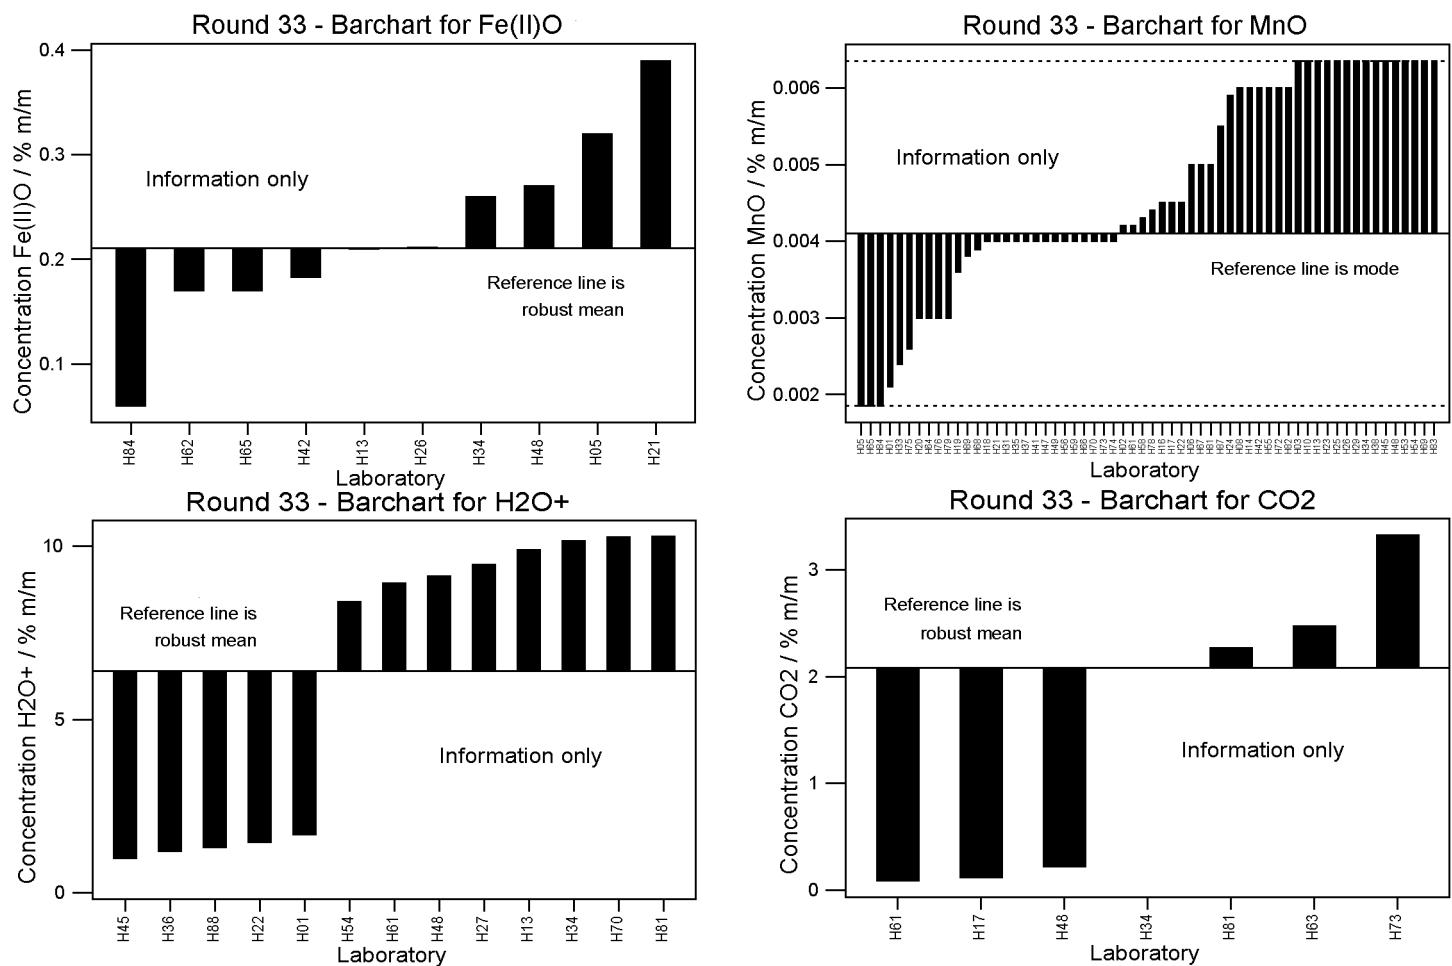

Figure 2.1: GeoPT33 – Ball clay, DBC-1. Data distribution charts for information only for elements for which values could not be assigned.

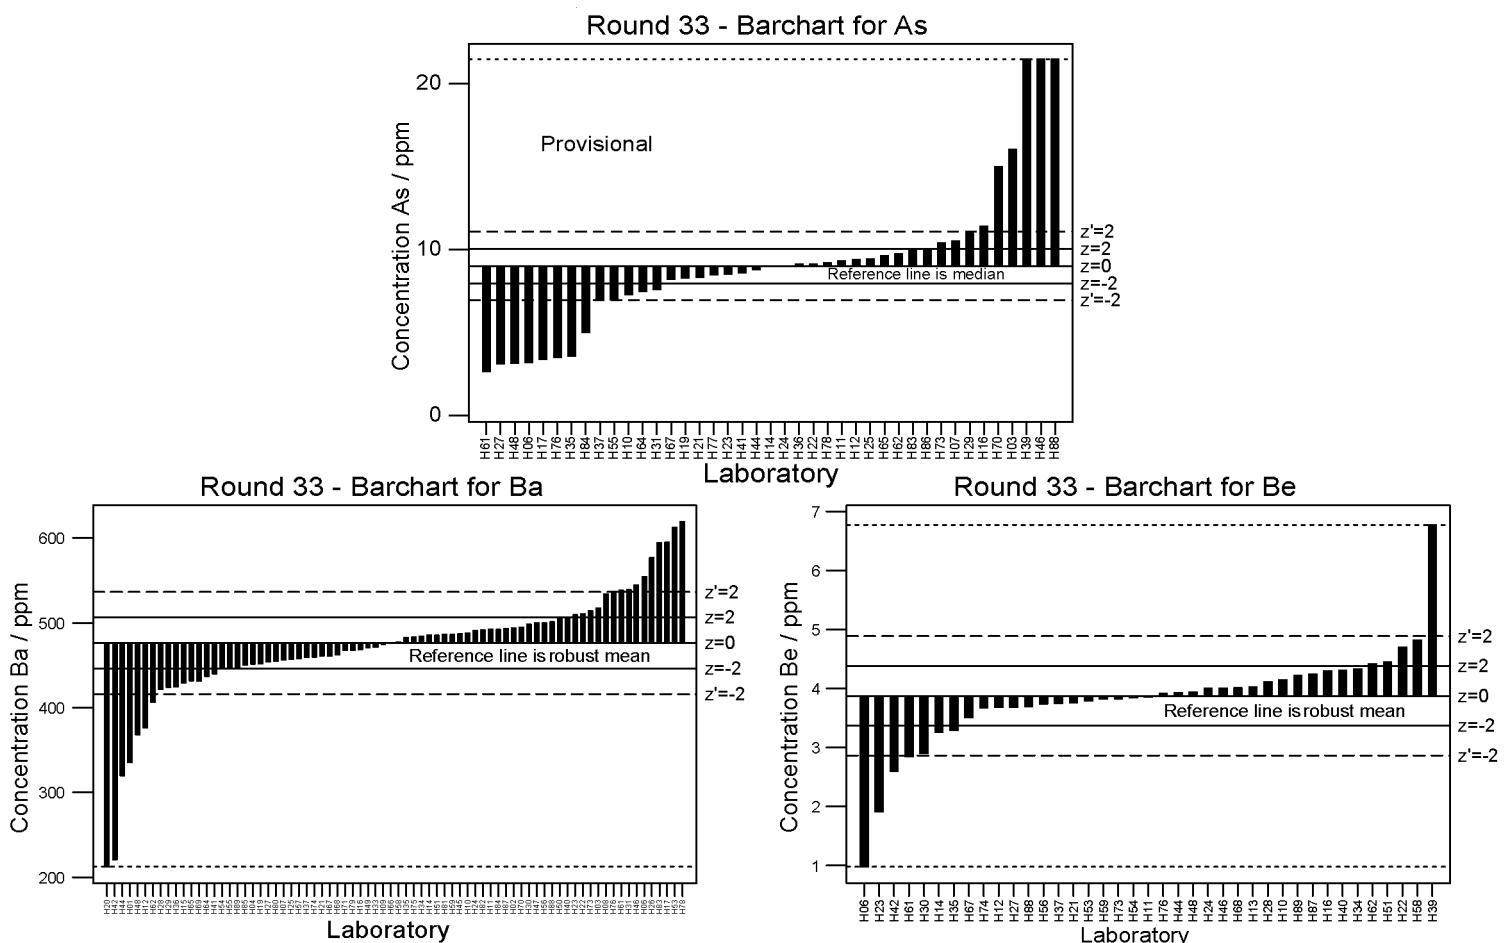

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

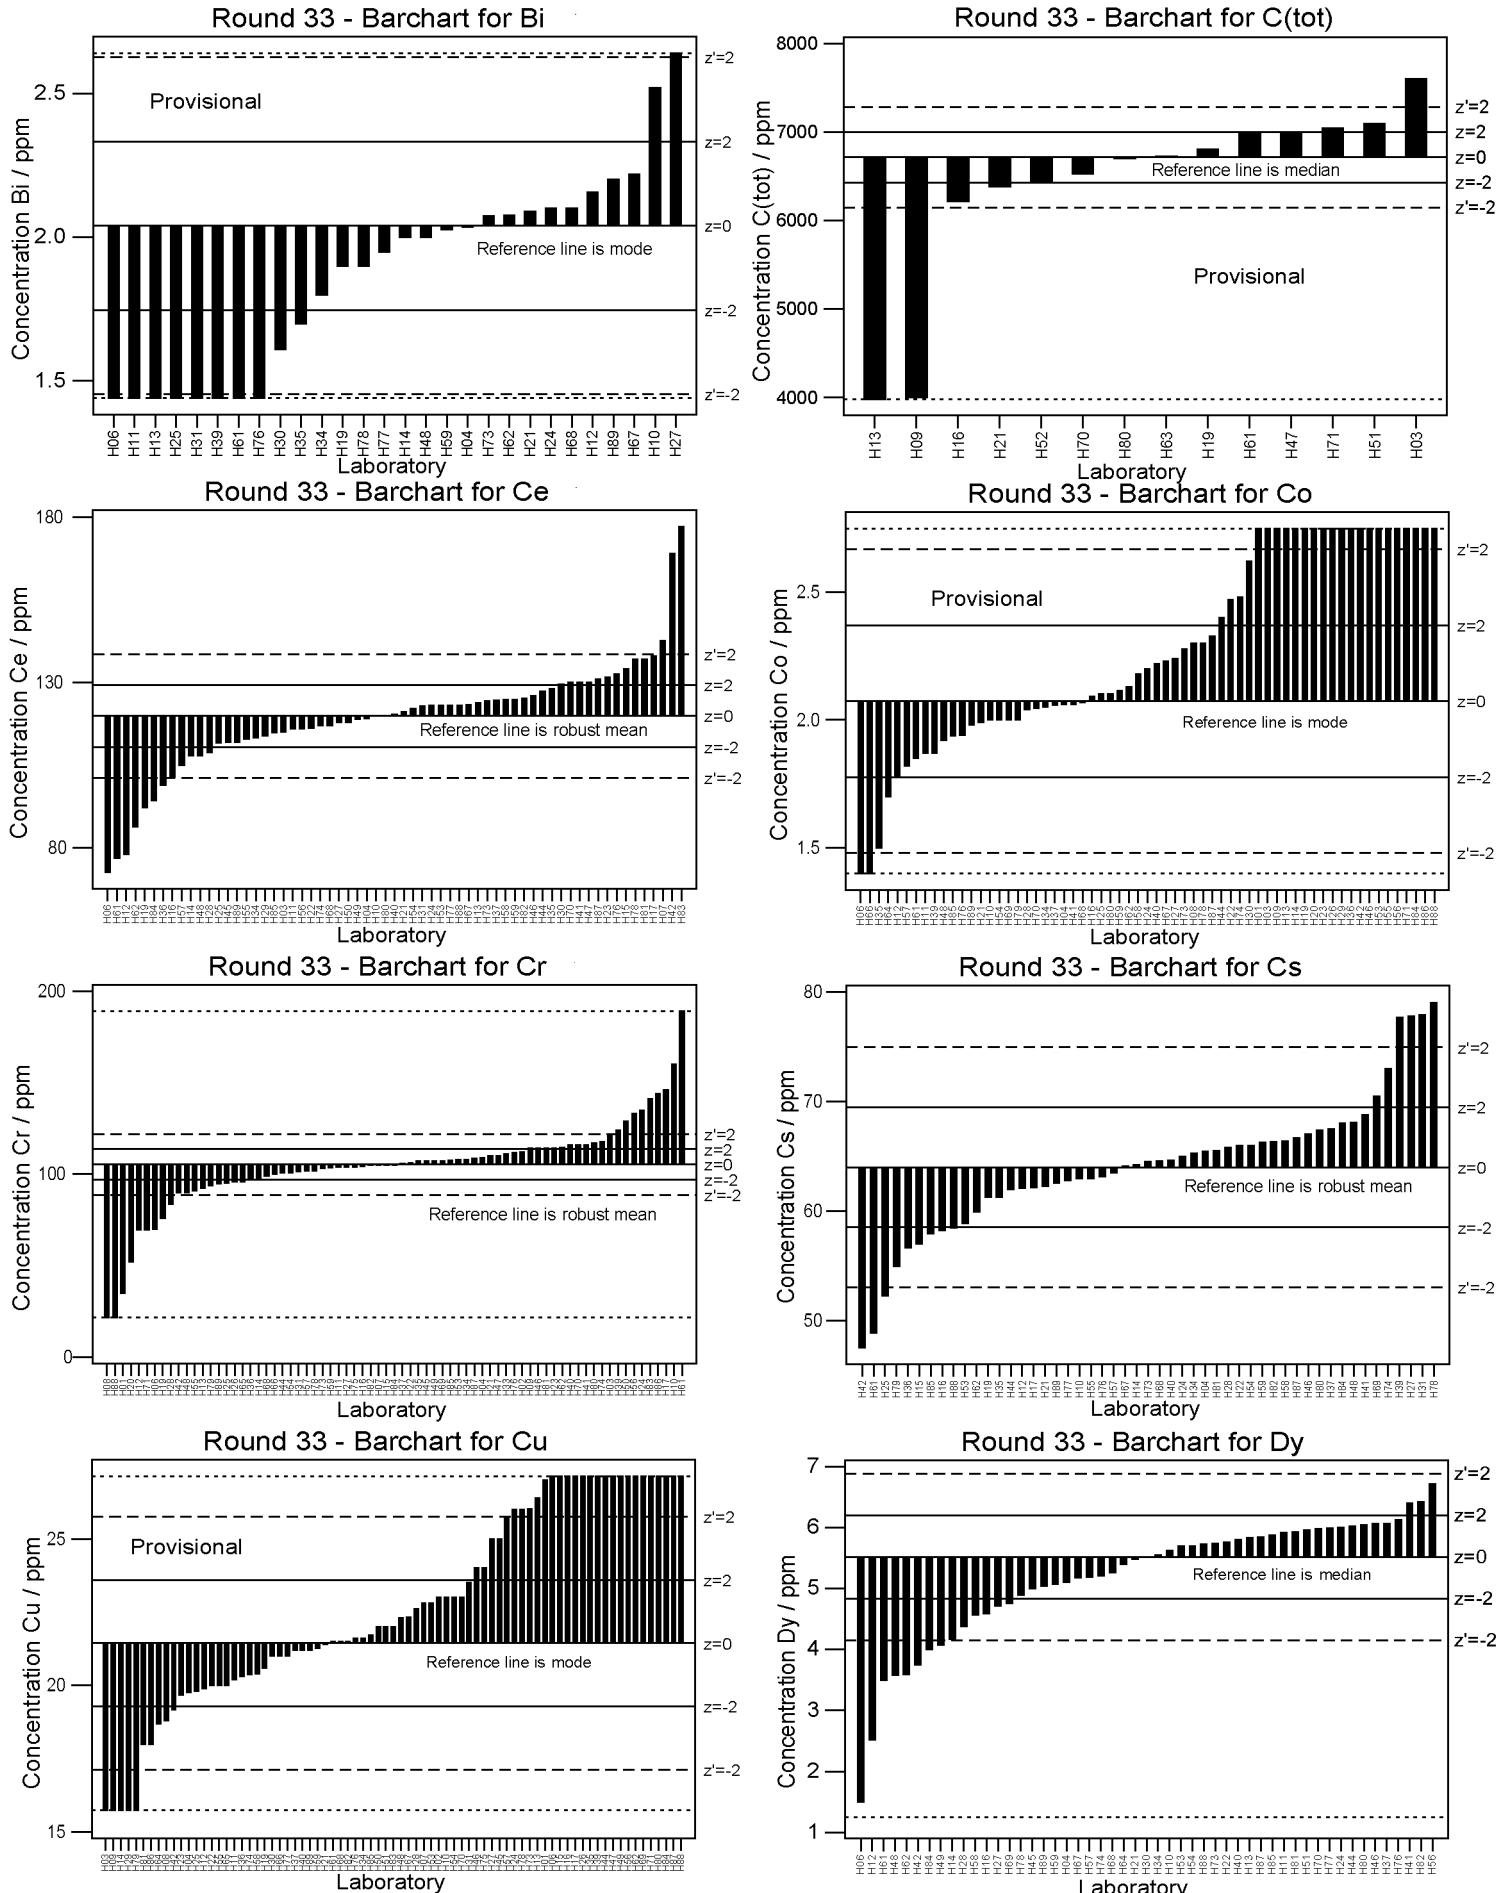

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

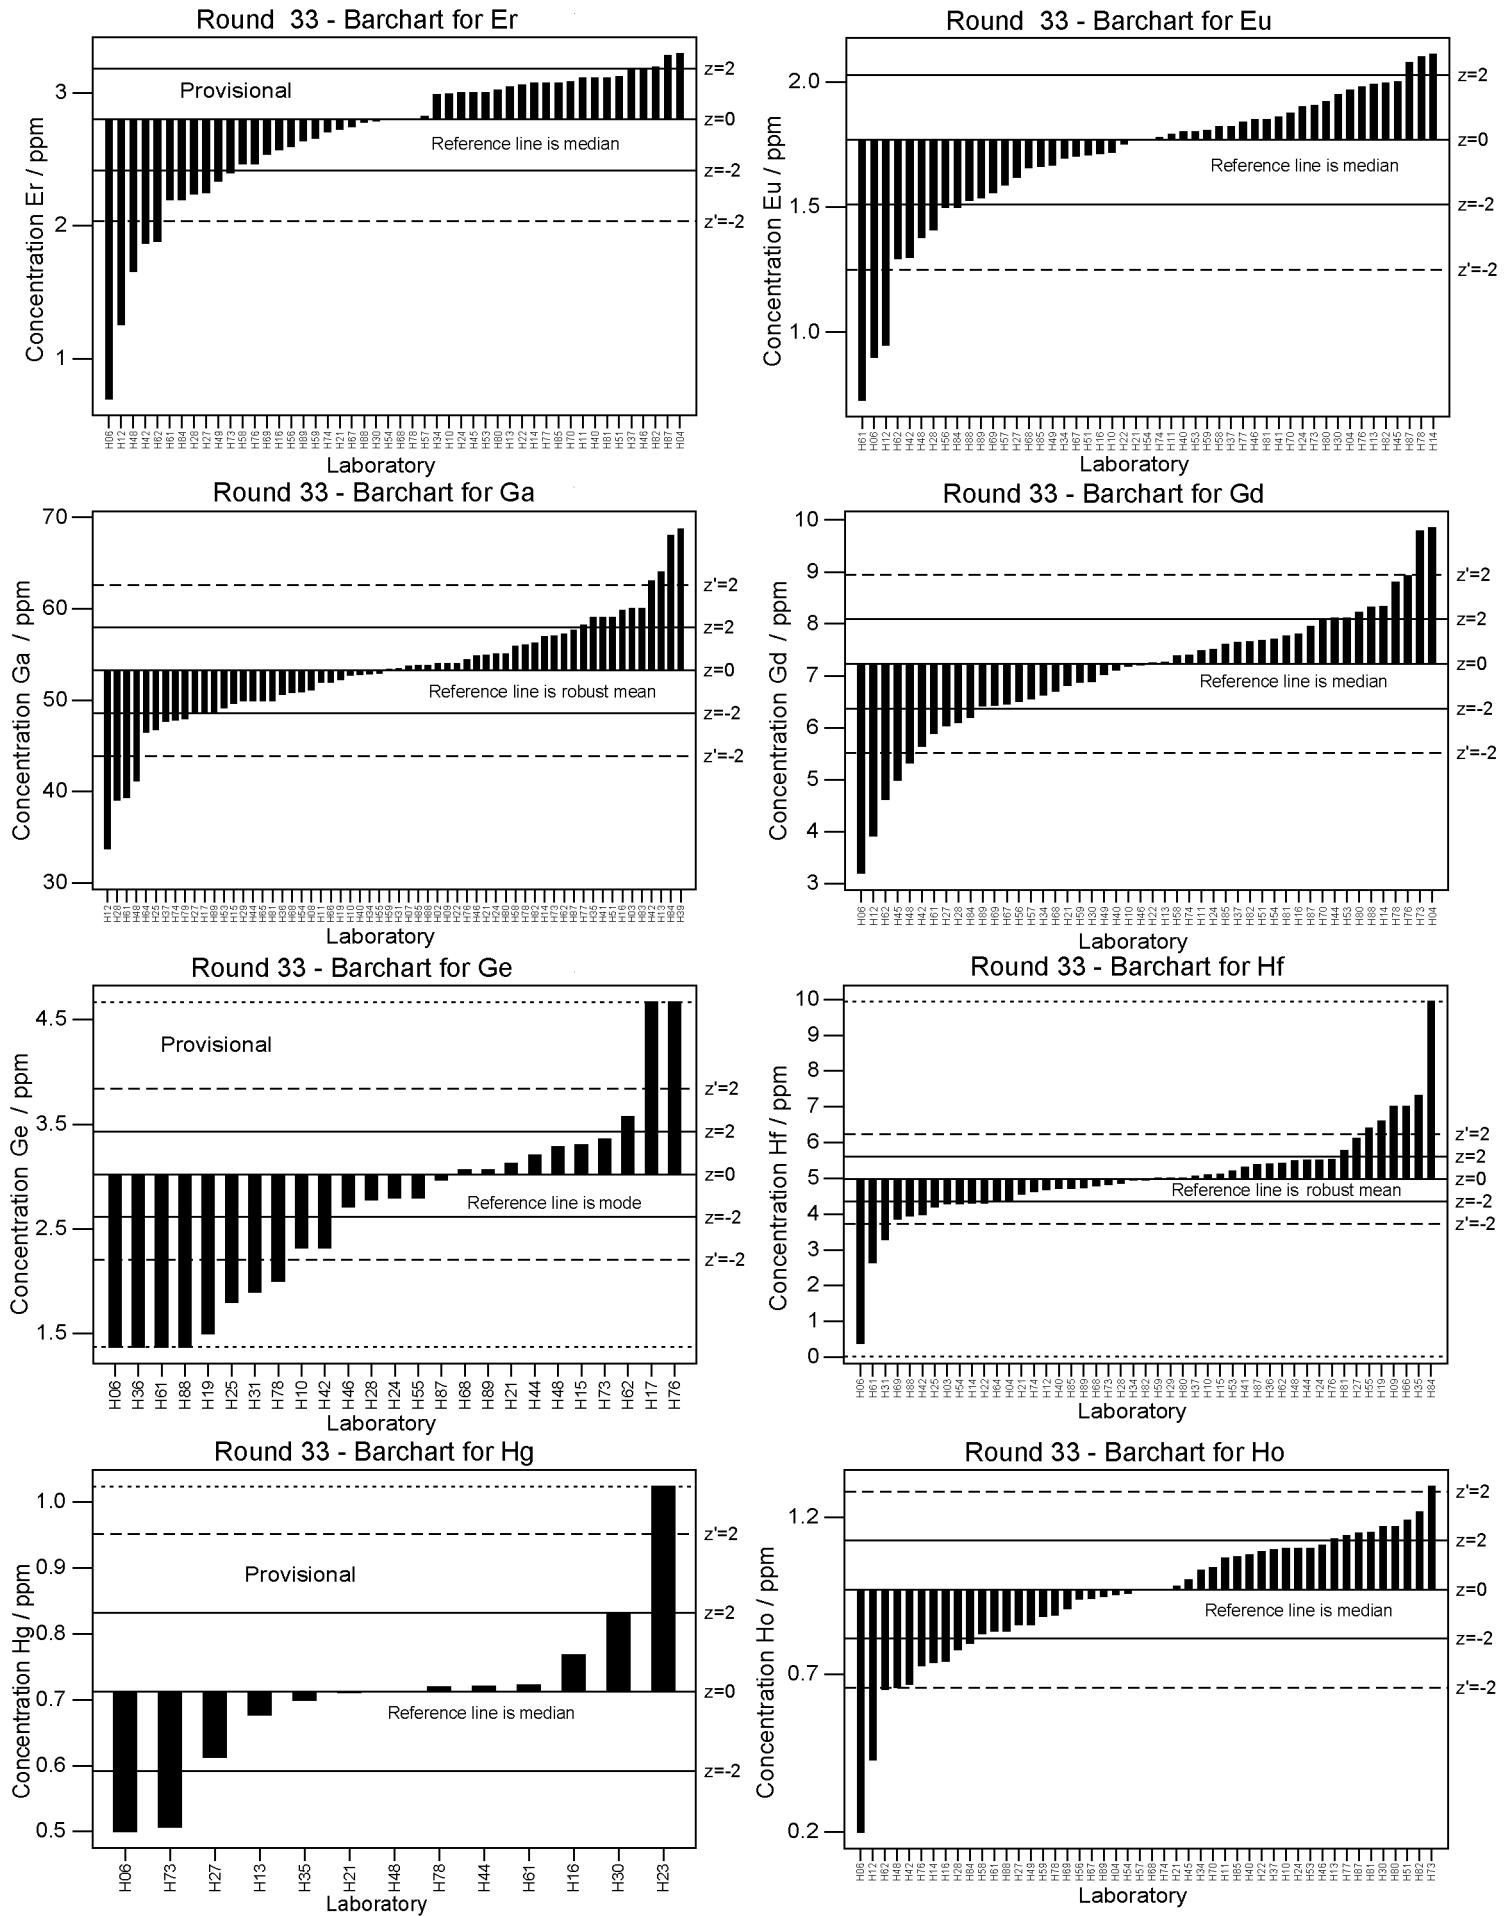

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

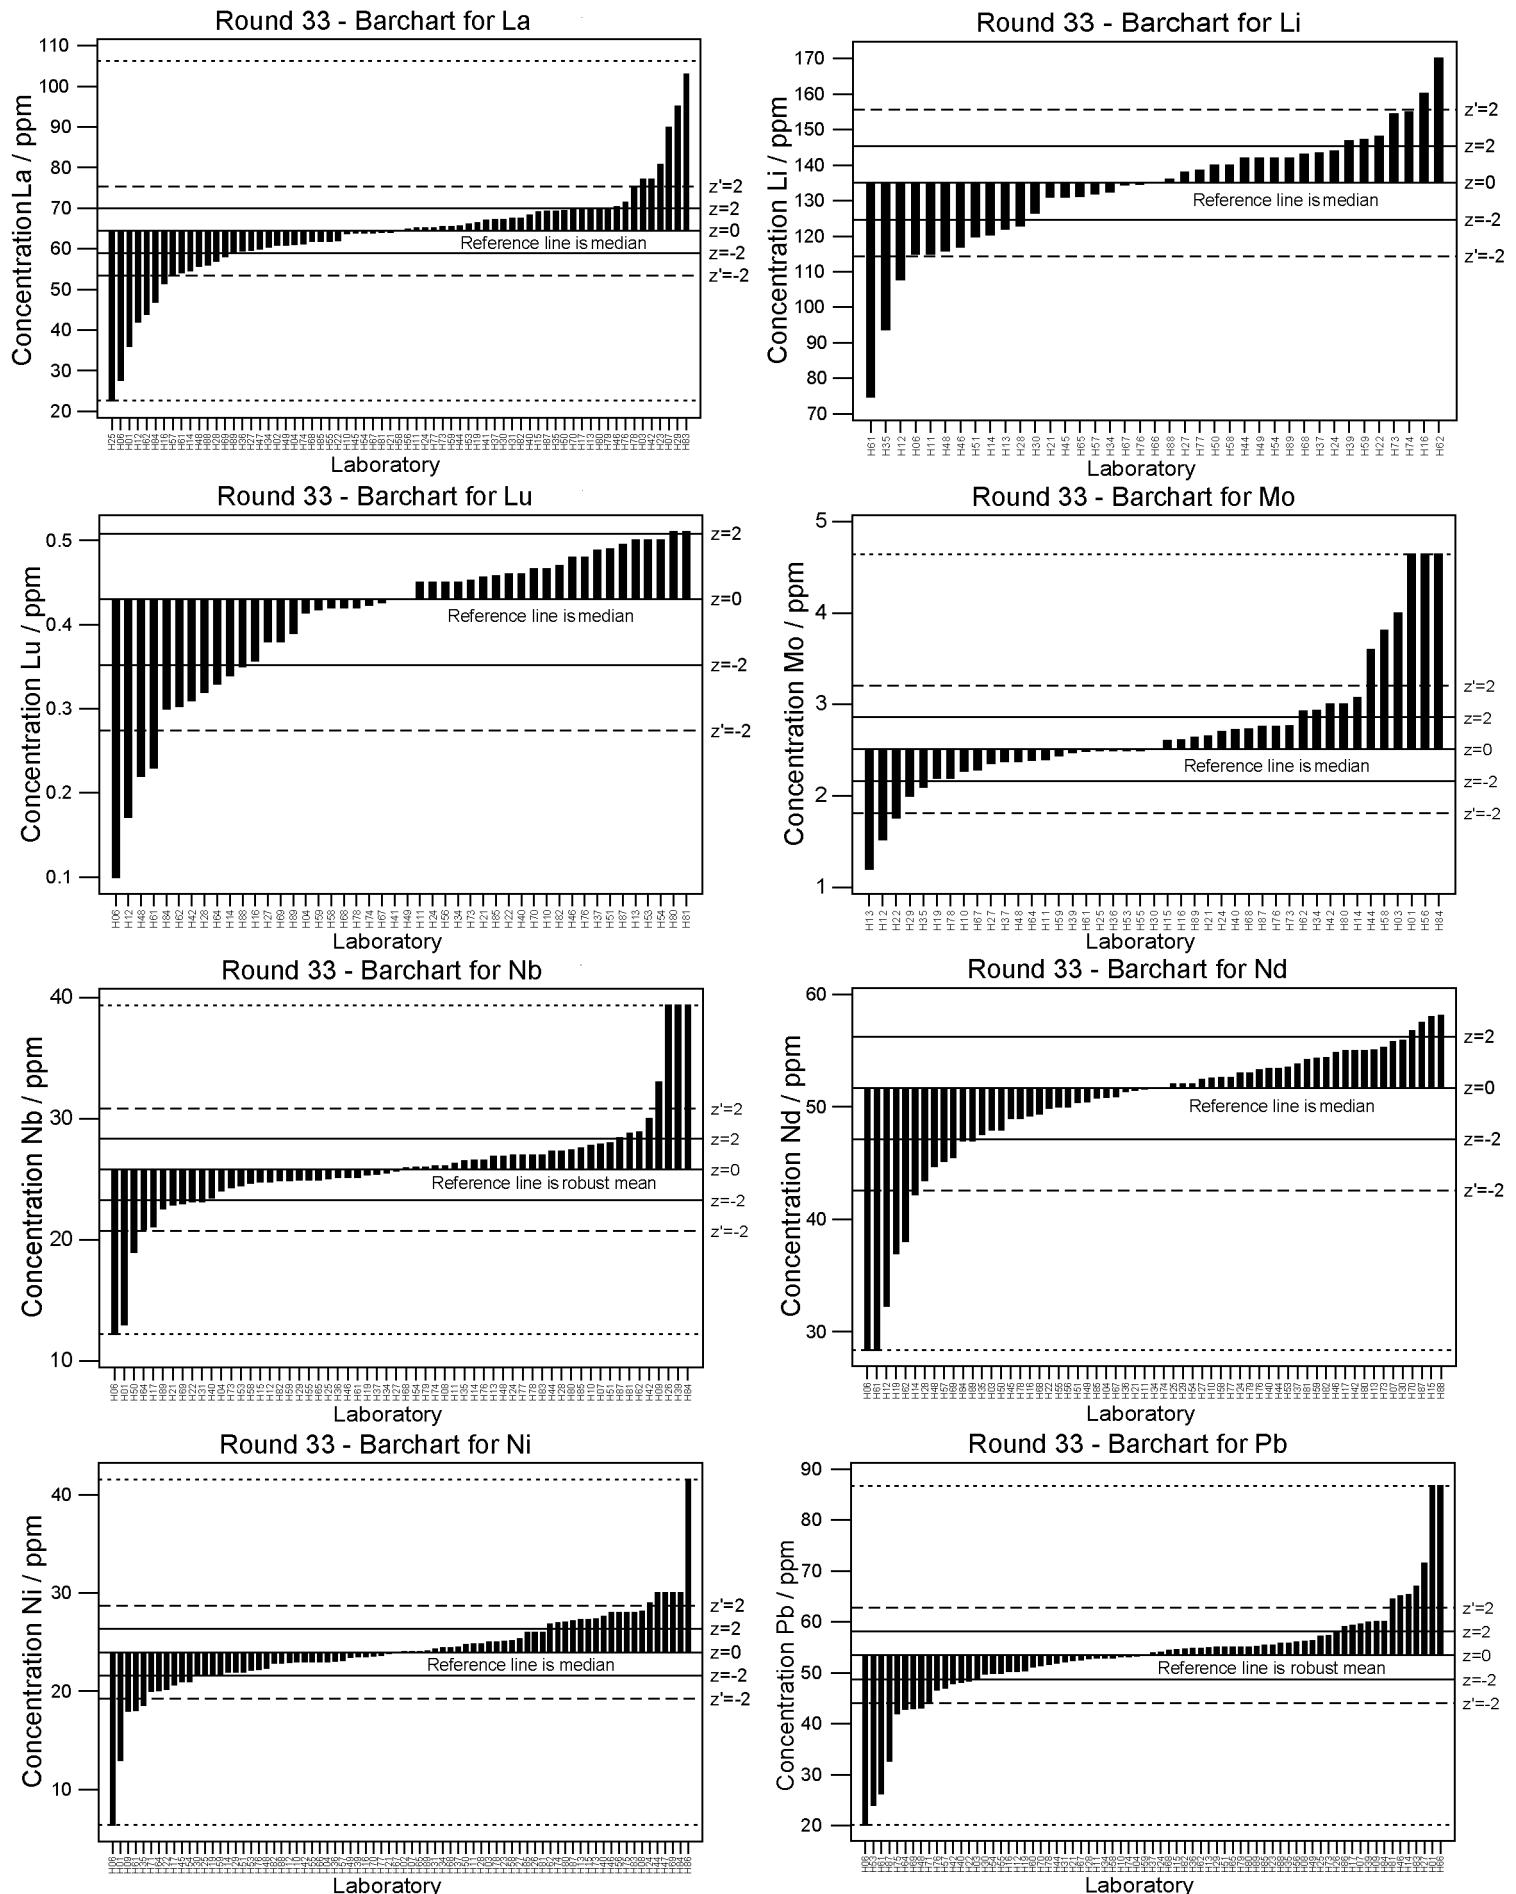

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

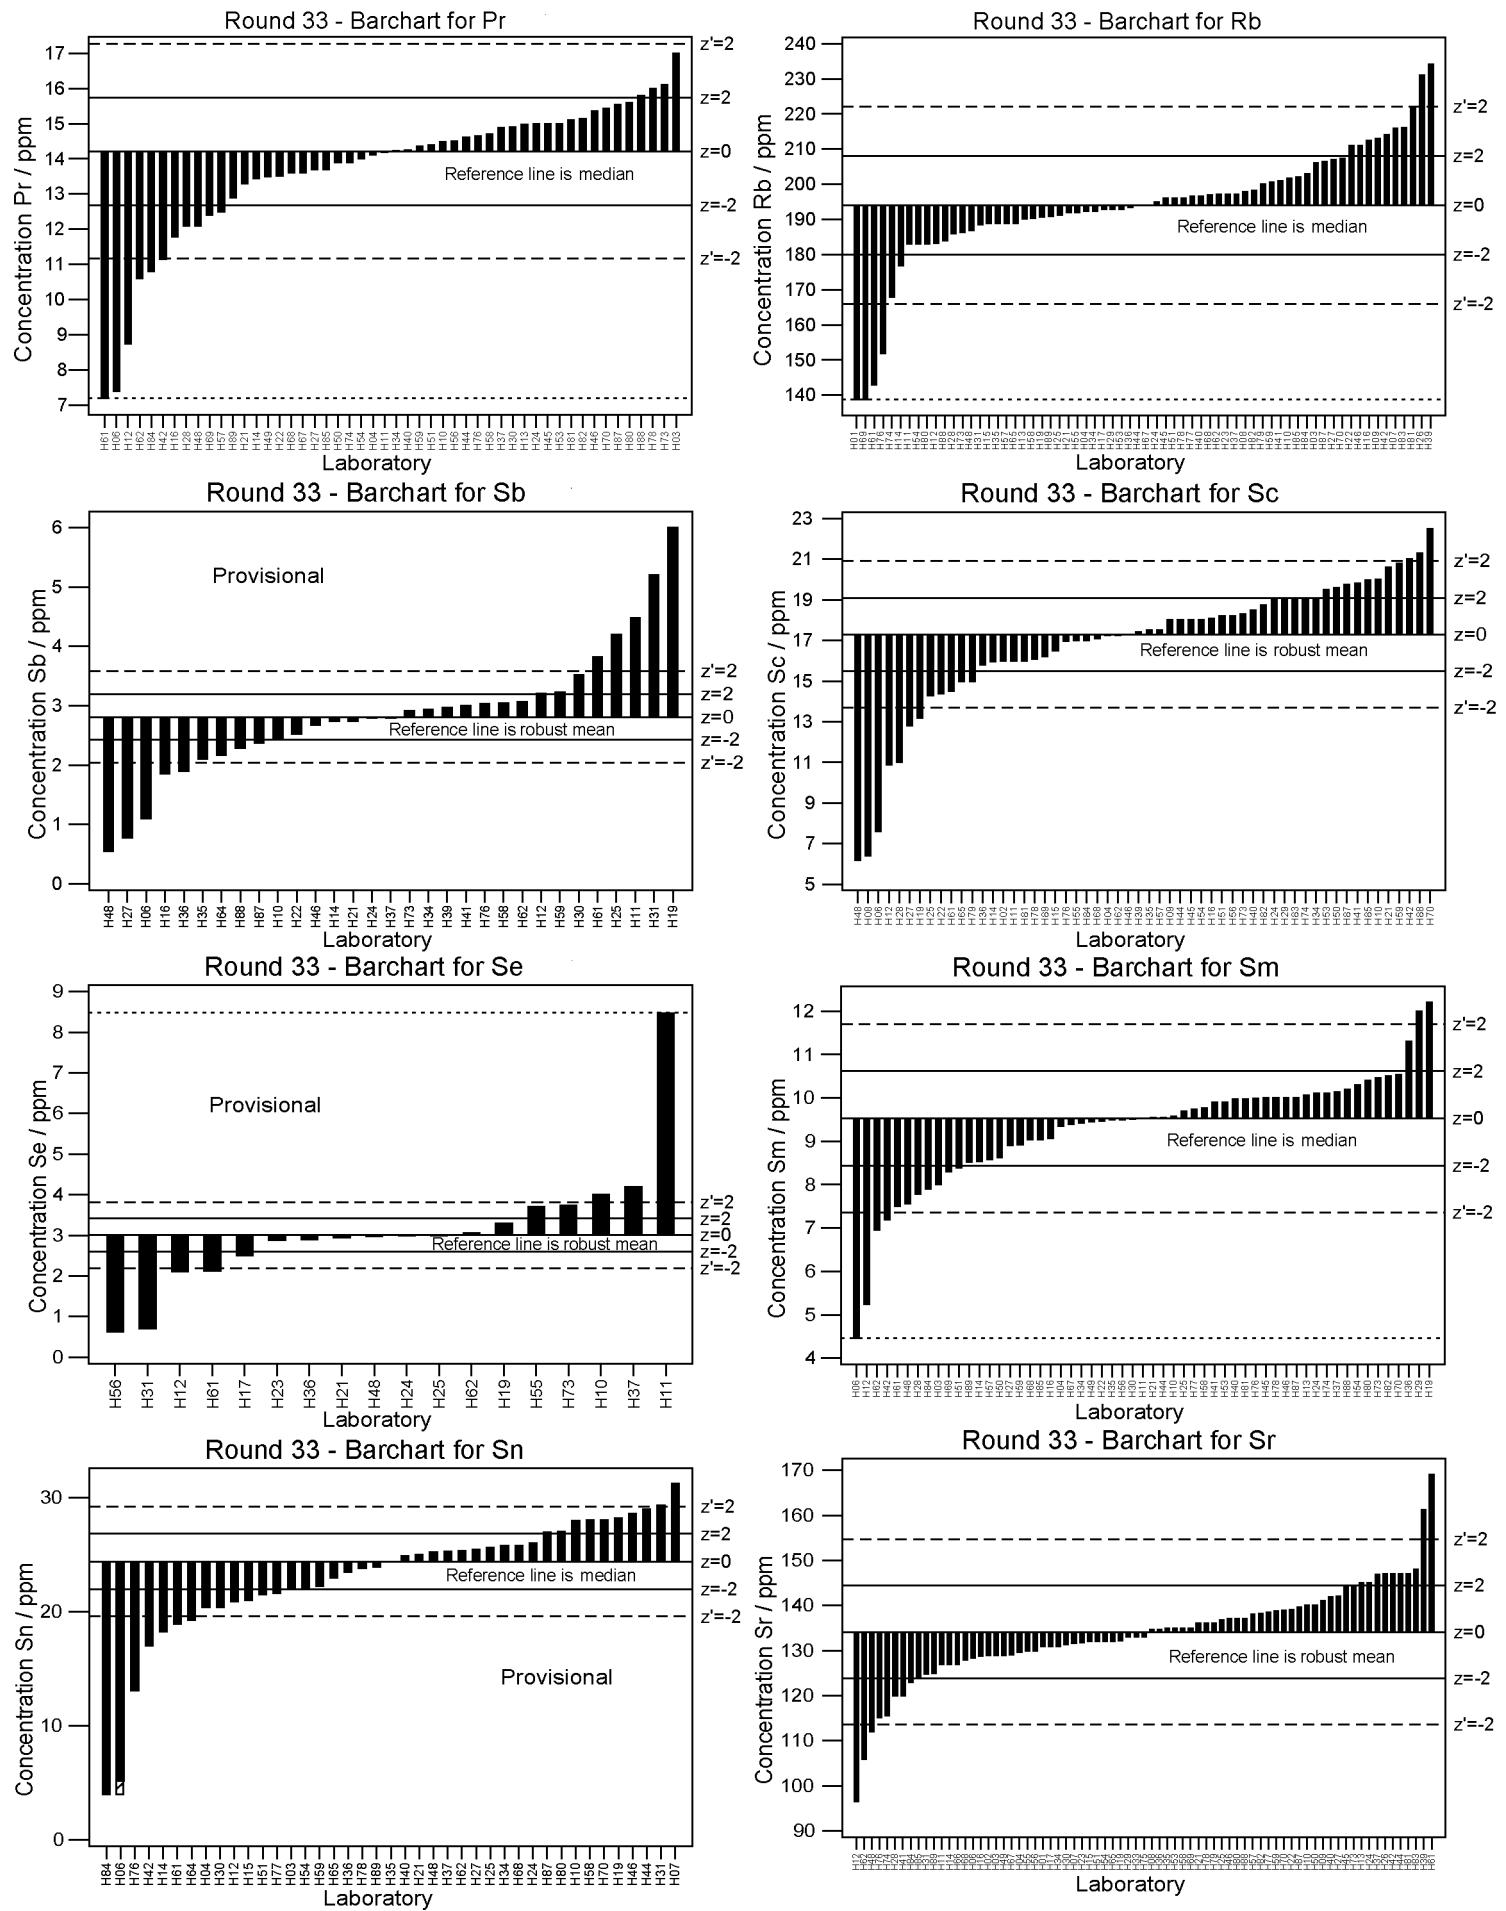

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

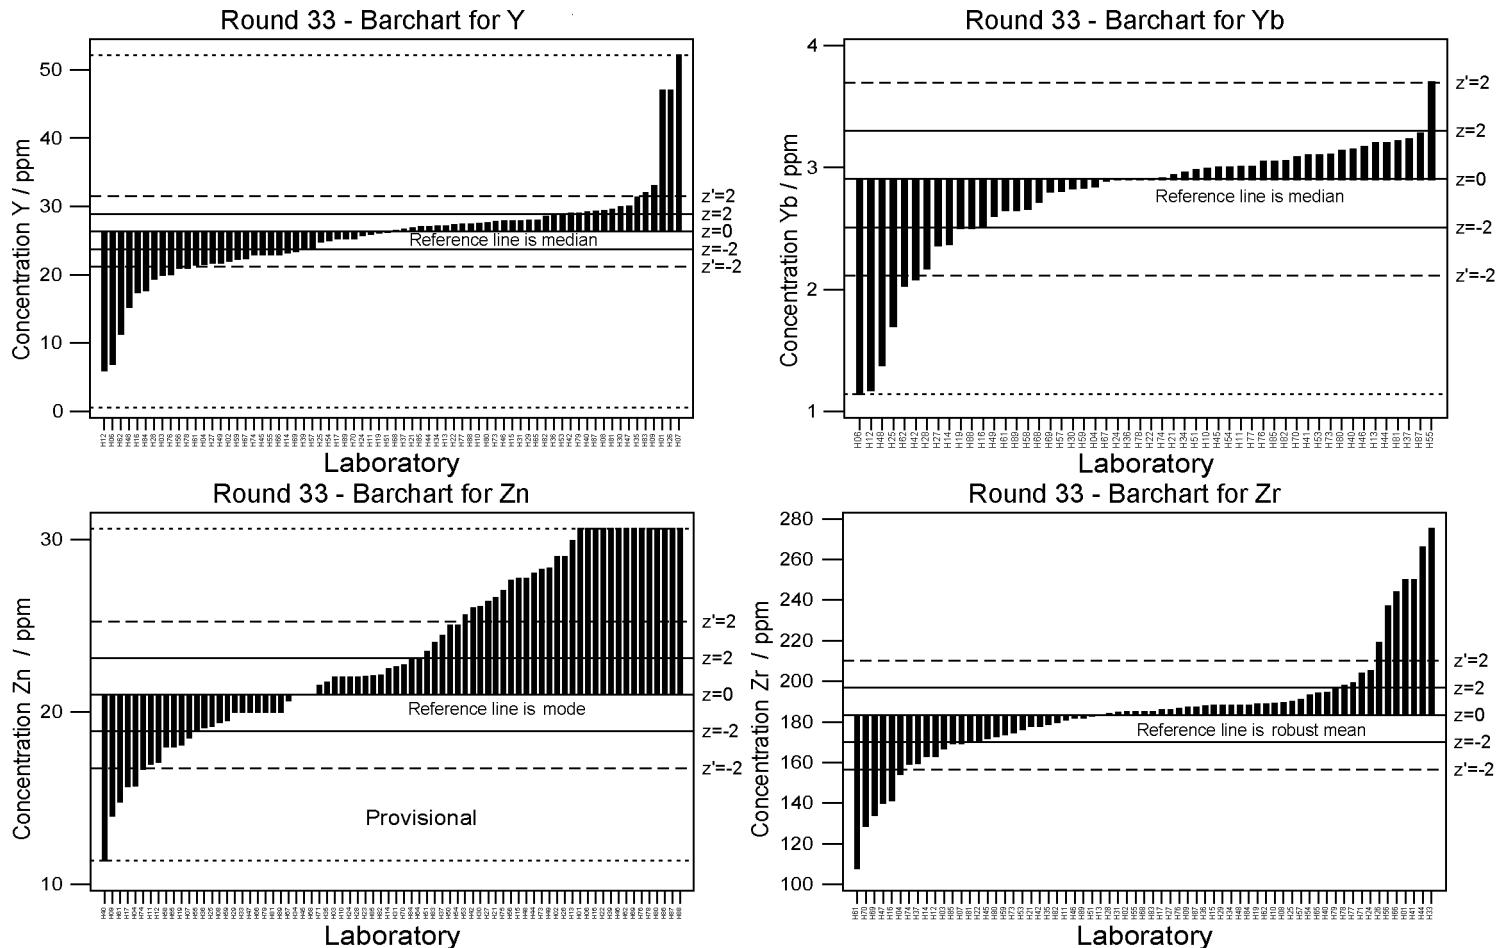

Figure 1.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for  $-2 < z < 2$  for pure geochemistry labs (solid lines) and  $-2 < z' < 2$  for applied geochemistry labs (pecked lines).

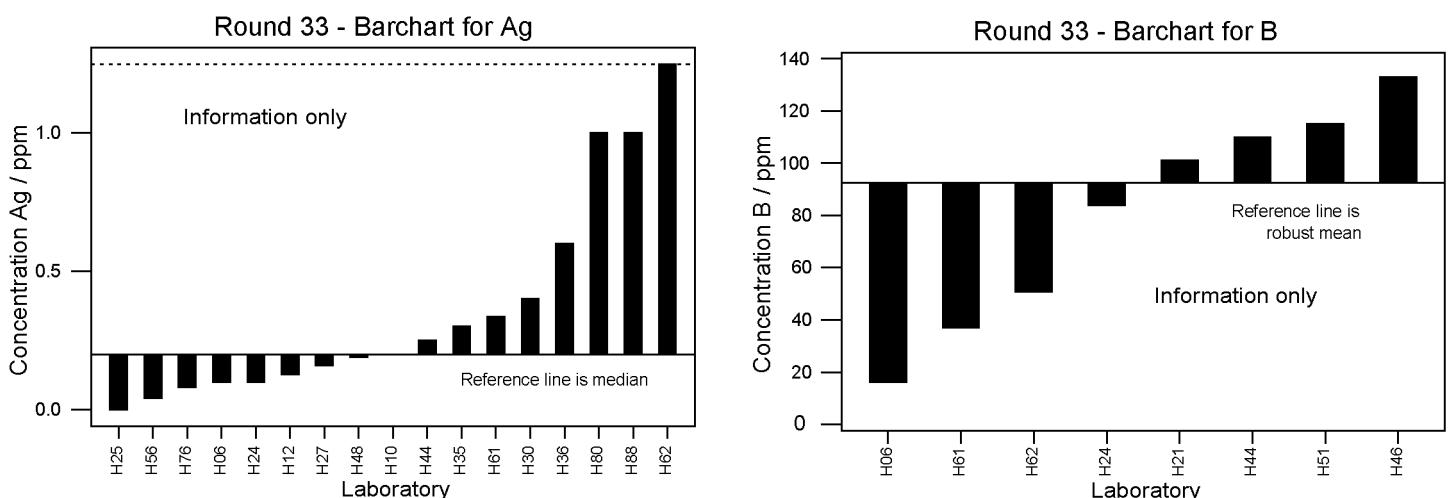

Figure 2.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for information only for elements for which values could not be assigned.

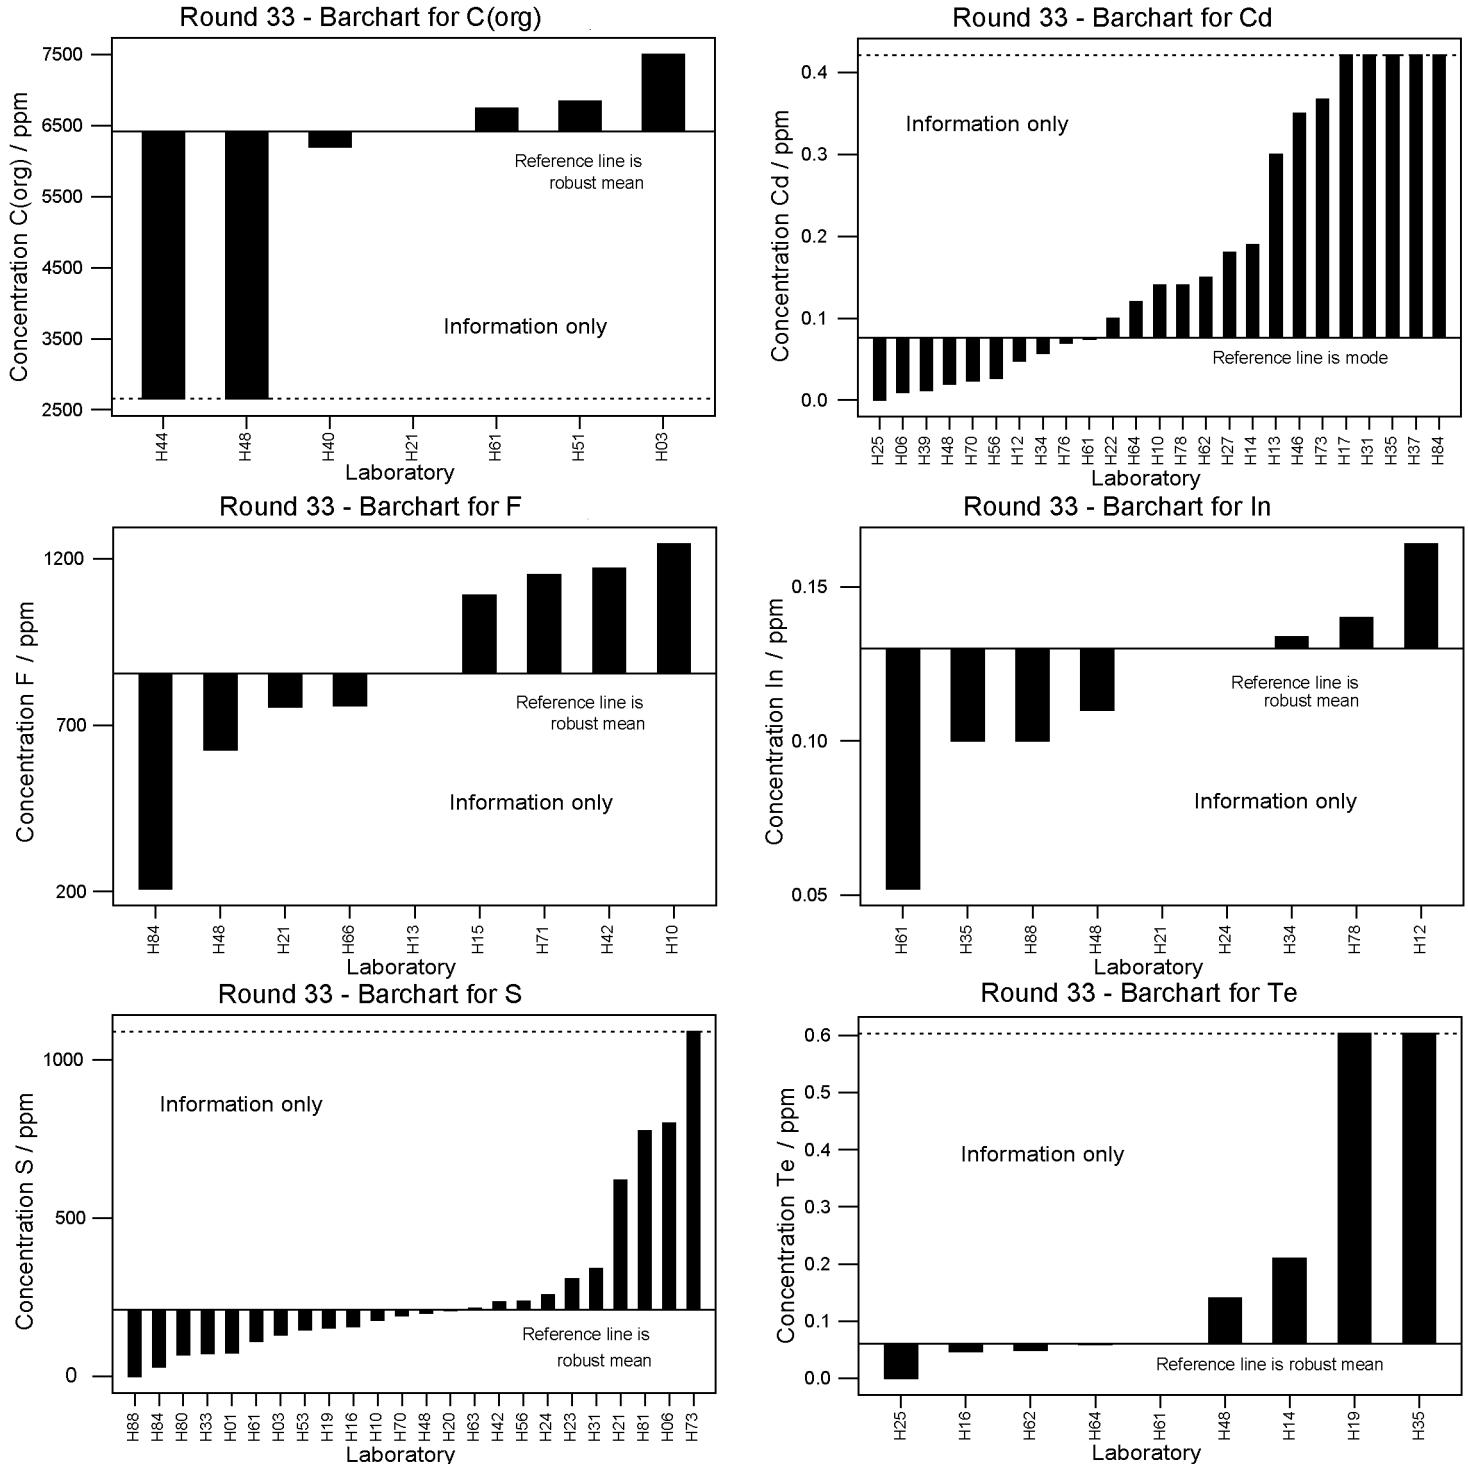

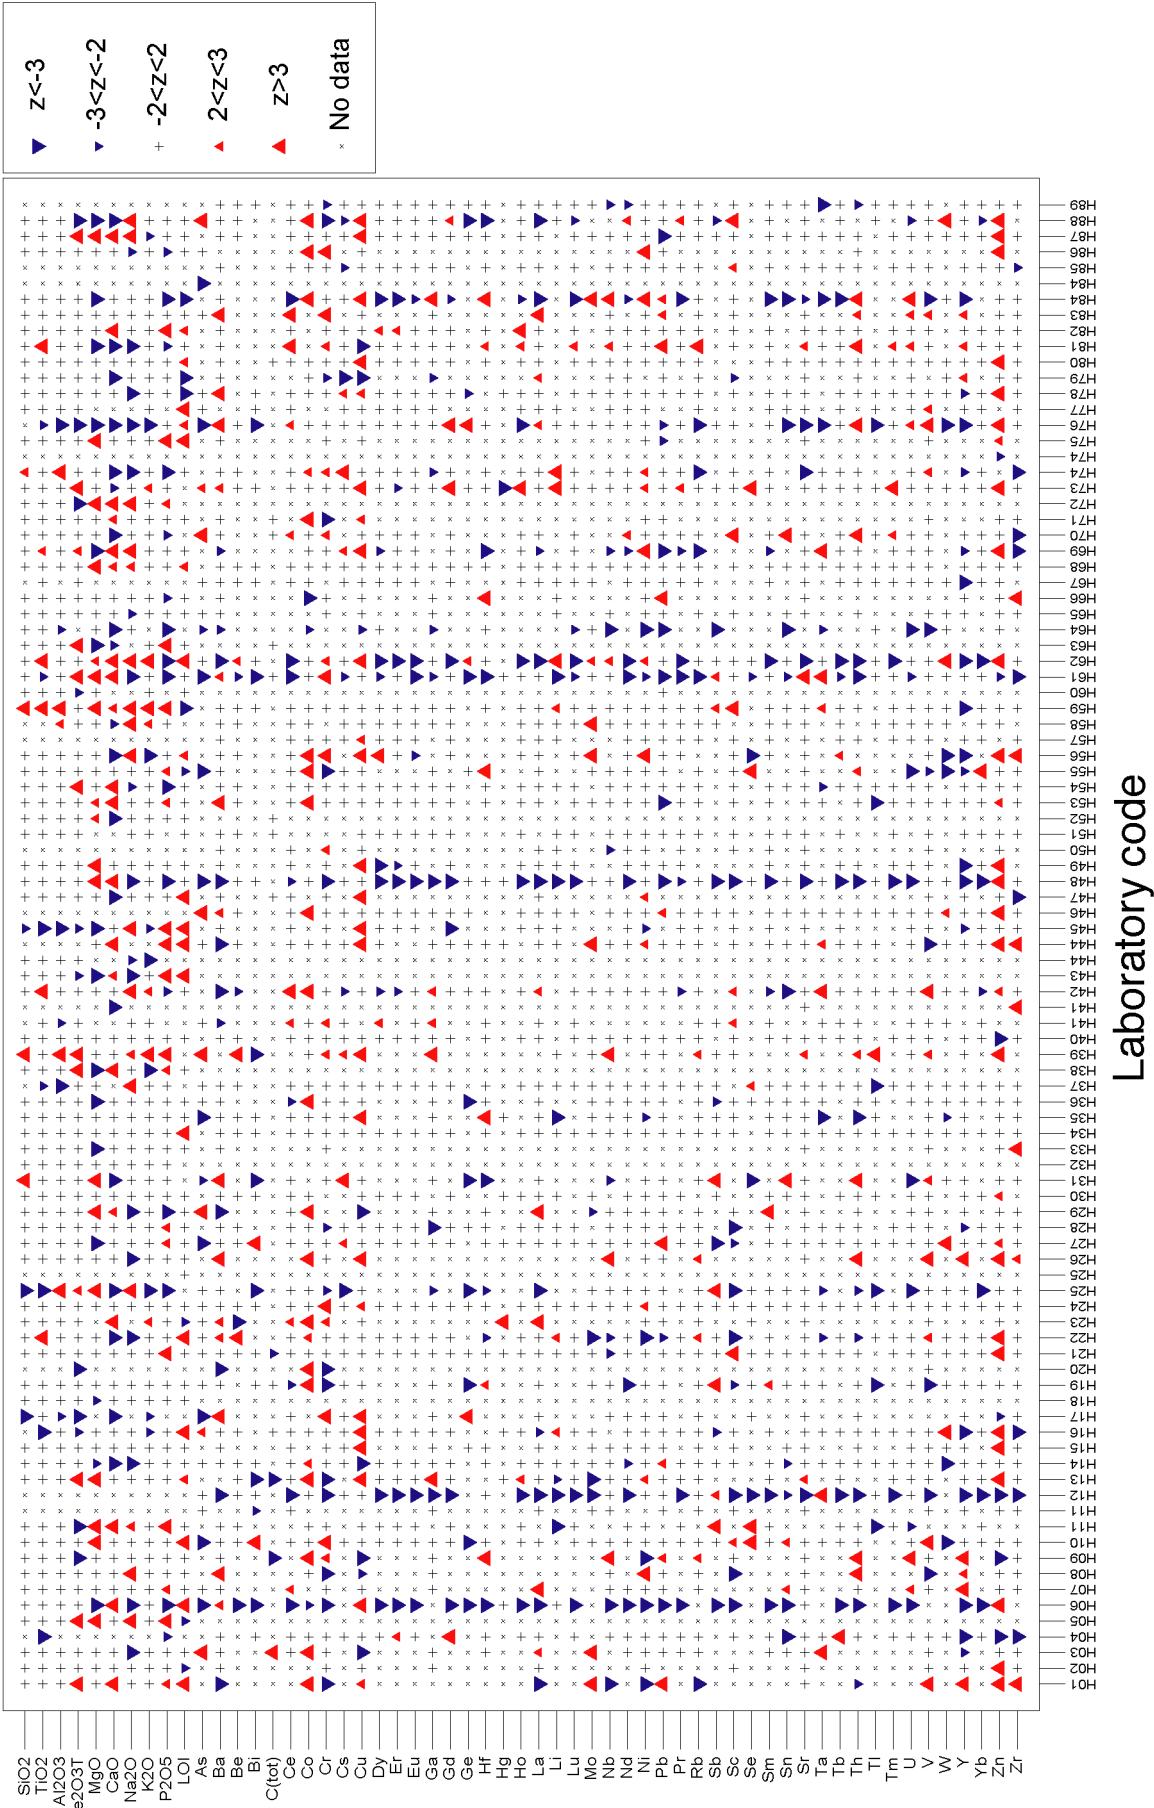

Figure 2.2: GeoPT33 – Ball clay, DBC-1. Data distribution charts for information only for elements for which values could not be assigned.

# Multiple z-score chart for GeoPT33

## Laboratory code

Figure 3: GeoPT33 – ball clay, DBC-1. Multiple z-score charts for laboratories participating in the GeoPT33 round. Symbols indicate whether or not an element result complies with the -2<Z<+2 criteria. Satisfactory data are plotted as '+''. Data for other categories are plotted as follows: Z<-3 (▲), -3<Z<-2 (●), +2<Z<+3 (●), Z>+3 (▲).
