Abstract

Results are presented for Round 41 of the International Association of Geoanalysts' Proficiency Testing programme for analytical geochemistry laboratories. The test material distributed in this round of GeoPT was an andesite, ORA-1, supplied by Dr Stephen Wilson of the U.S. Geological Survey. In this report, the data contributed by 93 laboratories are listed, together with an assessment of consensus values, consequent z-scores and charts to show the distribution of contributed results and the overall performance of participating laboratories.

Introduction

This forty-first round of the international proficiency testing programme, GeoPT, was conducted in a similar manner to earlier rounds. The programme is designed to be part of the routine quality assurance procedures employed by analytical geochemistry laboratories. The programme is organised by the International Association of Geoanalysts and is conducted in accordance with a published protocol available at (<http://www.geoanalyst.org/documents/GeoPT-protocol.pdf>). The overall aim of the programme is to provide participating laboratories with z-score information for reported elemental determinations from which the laboratory can decide whether the quality of their data is satisfactory in relation both to their chosen fitness-for-purpose criteria and to the results submitted by other laboratories contributing to the round. In

circumstances where z-scores are unsatisfactory, a participating laboratory is encouraged to investigate for unsuspected analytical bias and to take corrective action if this appears justified.

Steering Committee for Round 41: P.C. Webb (results coordinator), M. Thompson (statistical advisor), P.J. Potts and C.J.B. Gowing (analytical advisors), S.A. Wilson (provision of ORA-1).

Timetable for Round 41:

Distribution of sample: March 2017

Results submission deadline: 14th June 2017

Release of report: July 2017

Test Material details

GeoPT40A: The andesite test material, ORA-1, was supplied by Dr Stephen Wilson. The test material was evaluated for homogeneity by the originator, and as a result, the sample was considered suitable for use in this proficiency test.

Submission of results

A total of 3088 results were submitted for GeoPT41 (ORA-1) by 93 laboratories as listed in Table 1. Results that were designated by the participating laboratory as data quality 1 (see **Z-score analysis** section below for explanation) are shown in bold and results of data quality 2 are shown underlined. Results from all

laboratories submitting data were used to assess respective assigned values. Regrettably there were four laboratories reporting in total 12 values of '0' (i.e. zero), for this round, this excludes LOI, as zero is a valid result for LOI, as are negative values. We should emphasise that as stated in the *Instructions to Analysts*, values of zero for measurands other than LOI should not be reported. These 12 values were excluded from consideration in the data assessment process.

Assigned values

Following procedures described in earlier rounds, robust statistical procedures were used to derive assigned mass fraction values [X_a] for measurands in this test sample, these values being judged to be the best available estimates of the true composition. Values were assigned on the basis that: i) sufficient laboratories had contributed data for a measurand, and ii) visual assessment gave confidence that a substantial proportion of the results distribution was symmetrically disposed. Part of this assessment involved examining the distribution of results from bar charts of contributed data for each measurand (presented in Figures 1 and 2). For this round, it has also been possible to view data distributions according to analytical procedure and visually assess the comparative quality of data obtained using different procedures.

Many datasets were normally disposed and showed remarkable symmetry with relatively little dispersion of data. Consequently, in 18 cases, the robust mean was used to define an appropriate consensus value. However, many other datasets were slightly skewed and some, more severely skewed. In many of such cases medians provided a satisfactory estimator for defining consensus values: 16 cases in all. Where the median did not provide a symmetrical distribution of data about the consensus, the mode was preferred, and was used in 16 cases for defining a consensus.

In most cases, a mode was used as a consequence of an asymmetric distribution of results involving a high tail of highly variable data. Sometimes, but not always, the reason for the high tail was because XRF data had been

reported for mass fractions close to the detection limit for the technique and measured values consequently had poor precision and accuracy. A significant proportion of XRF data was highly variable leading to high tails for Cs, Sb, Sn, Th and U. In a number of cases, in particular for $\text{Fe}_2\text{O}_3\text{T}$, Co, Cr, Ni, V and Zn, XRF powder pellet values were generally lower and more variable than data reported by other techniques. We do not have an explanation for this observed bias, but use of modes as location estimators helped to avoid bias in many of these datasets. In 10 cases, modes were sufficiently well defined by appropriate techniques to justify their designation as assigned values. In the other six cases provisional status was judged most appropriate (see Table 2). Procedures used to determine the mode included the estimation of the mass fraction corresponding to the maximum value of the kernel density distribution for the dataset and the Lientz mode (Lientz, 1969) as provided by the "modeest" package which runs in "R" (<https://cran.r-project.org/web/packages/modeest/modeest.pdf>). Modes are suitably robust location estimators that can provide consensus values to represent the most coherent part of a data distribution where data are often symmetrically disposed, whereas the dataset as a whole is asymmetric.

Table 2 lists assigned and provisional values for 10 major components and 40 trace elements in GeoPT41 (ORA-1). Bar charts for the 50 measurands of GeoPT41 that were judged to have satisfactory distributions for consensus values to be designated as assigned or provisional values are shown in Figure 1. These are: SiO_2 , TiO_2 , Al_2O_3 , $\text{Fe}_2\text{O}_3\text{T}$, MnO, MgO, CaO, Na_2O , K_2O , P_2O_5 , Ba, Be, Ce, Co, Cr*, Cs, Cu, Dy, Er, Eu, Ga, Gd, Hf, Ho, La, Li, Lu, Mo*, Nb, Nd, Ni*, Pb, Pr, Rb, Sb*, Sc, Sm, Sn*, Sr, Ta, Tb, Th, Tl*, Tm, U, V, Y, Yb, Zn and Zr. Of these, provisional values were given to the 6 measurands marked '*'. Instances of provisional status were recorded because either i) a relatively small number of results contributed to the consensus, or ii) the results were unduly dispersed in relation to the target value, or iii) the distribution of values was notably skewed.

Bar charts for the 13 measurands: Fe(II)O, H₂O⁺, LOI, Ag, As, Bi, C(tot), Cd, Cl, F, Ge, In and W are plotted in Figure 2 for information only, as the data were either insufficient in number, or the distribution was too highly skewed or too variable for the reliable determination of a consensus for the estimation of *z*-scores.

Fewer LOI data were reported in this round compared with most other recent rounds. This may have reflected a reluctance by analysts to report negative numbers. Volatile loss was quite low in this sample and combined with a gain on ignition due to oxidation of FeO to Fe₂O₃, it may have resulted in a gain on ignition which would correspond to a negative loss on ignition. The main body of values reported ranged from about -0.2 to about +0.4 g/100g, with a median of 0.02 g/100g (see Figure 0.1). The consensus appears to be in the range 0.00 to 0.04 g/100g. Please also see **Addendum** with respect to LOI.

Z-score analysis

As in previous rounds, laboratories were invited to choose one of two performance standards against which their analytical results would be judged:

Data quality 1 for laboratories working to a 'pure geochemistry' standard of performance, where analytical results are designed for geochemical research and where care is taken to provide data of high precision and accuracy, sometimes at the expense of a reduced sample throughput rate. For GeoPT41, 1362 results of data quality 1 were submitted.

Data quality 2 for laboratories working to an 'applied geochemistry' standard of performance, where, although precision and accuracy are still important, the main objective is to provide results on large numbers of samples collected, for example, as part of geochemical mapping projects or geochemical exploration programmes. For GeoPT41, 1726 results of data quality 2 were submitted.

The target standard deviation (H_a) for each measurand assessed was calculated from a modified form of the Horwitz function as follows:

$$H_a = k.X_a^{0.8495}$$

Where X_a is the mass fraction of the element; the factor $k = 0.01$ for pure geochemistry laboratories and $k = 0.02$ for applied geochemistry laboratories.

Figure 0.1. Distribution of loss on ignition results for ORA-1 (GeoPT41). The consensus appears to be within the range 0.00 to 0.04 g/100g. The horizontal line is drawn at the median value of 0.02 g/100g.

Z-scores were calculated for each elemental measurement submitted by each laboratory from:

$$z = [X - X_a] / H_a$$

Where X is the contributed measurement, X_a is the assigned value and H_a is the target standard deviation (all as mass fractions). Z-score values for results contributed to GeoPT41 are listed in Table 3. Results designated as data quality 1 are shown in bold: results of data quality 2 are shown underlined. Z-scores derived from provisional values are shown in italics.

Participating laboratories are invited to assess their performance using the following criteria:–

Z-score results in the range $-2 < z < 2$ are considered to be 'satisfactory' (in the sense that no action is called for by the participant). If the z-score for any element falls outside this range, especially if it is outside the range $-3 < z < 3$, contributing laboratories are advised to examine their procedures, and if necessary, take action to ensure that determinations are not subject to unsuspected analytical bias.

Overall performance

A summary of the overall performance of individual laboratories for this round is plotted in multiple z-score charts in Figure 3. In these charts, the z-score performance for each element is distinguished by symbols that make it simple to identify whether the results were satisfactory or gave z-scores that exceeded the action limits. This chart is designed to help individual laboratories to judge their overall performance in this proficiency testing round. Participants should always review their z-scores in accord with their own fitness-for-purpose criteria.

Participation in future rounds

The benefit from proficiency testing arises from regular participation and laboratories are invited to contribute to Round 42, the test sample for which will be distributed during September 2017.

Acknowledgements

The authors thank Cynthia Turner for much-valued assistance in distributing this sample and Thomas Meisel for development of software which has greatly assisted the investigation of data according to analytical procedure and facilitated analysis of datasets involving alternative modes as provided in the package “modeest”, which is available as an “R” package (<https://cran.r-project.org/web/packages/modeest/modeest.pdf>).

Addendum

Important note for analysts: In the **Instructions for Analysts** accompanying your samples for this round, there was a "*specific request that if your procedures involve ignition or fusion, to ensure that you provide additional details where appropriate*" and further details were provided in the notes, viz. "**Procedures involving fusion, sintering or ignition, particularly LOI determinations: Please ensure that you have specified the temperature used and where necessary, the end-point criterion, e.g. duration of ignition, as Additional Details, in your descriptions of all relevant procedures.**"

Our thanks to those who did comply with this request, but it appears that in many cases it was ignored. Please ensure that these details are provided for future rounds, as it will assist in assessing data variations. Also, please ensure that LOI is listed with a *separate procedure* and not subsumed with the procedure applied to major element components.
