

G-probe 17 Summary Report

March 2017

Stephen Wilson

A total of twenty six labs submitted final results during this stage of the G-probe 17 study. Technique breakdown was, nineteen labs used LA-ICP-MS, five used SEM, six used EPMA and one provided information using miro-XRF. Five labs reported results using multiple techniques. Starting material used in glass preparation was donated by the Geological Survey of Japan. The starting powdered material is identified at JGB-1 and the glass version as JGb-1G.

Conversion of JGB-1 to a glass was accomplished at the USGS by melting 300 g of JGB-1 in a one liter platinum bowl at 1325° C over a period of six hours. At the end of the melting period the molten material was poured into a platinum boat and rapidly lowered into a water bath for quenching. Twenty grams of random fragments were selected, ground and then split into representative aliquots for bulk analysis testing. Samples were analyzed for their total element content using techniques at the USGS and Agat Laboratories, Canada. If you have any questions or comments about this study please forward them to me at your earliest convenience.

Below you will find summary results for each element studied in this test. In the element diagrams you will find information for each technique providing a value. Also included is the target value (♦) and calculated precision ($X \pm Ha$) (◆) based on the Horowitz equation. A figure is also presented representing the data compilation for the entire study when more than one technique reported values. The study average is represented by ■, the standard deviation of the average by □ and the maximum and minimum values by ▨. This study average is calculated primarily for the analysis of the major elements where multiple techniques provided data. For each technique an average value is presented (ex. LA-ICP-MS, ▲) as well as ± one standard deviation (ex. LA-ICP-MS, △), and the maximum and minimum values reported (ex. LA-ICP-MS, Δ).

Table 1. Symbols used on figures 1 through 52

| <u>Symbol type</u> | | <u>Represents</u> |
|---------------------|---|--|
| Large solid symbol, | ● | Study or method average |
| Small solid symbol, | • | Study or method one standard deviation |
| Large open symbol, | ○ | Study or method Maximum or Minimum |

Organizations interested in providing suitable starting materials for future G-probe studies are encouraged to contact Stephen Wilson at the U.S. Geological Survey (swilson@usgs.gov). Contributors of suitable starting materials will receive a complimentary portion of the produced glasses.

Table 2. Summary results for GP-17, JGB-1G

Xa = Target value - USGS bulk analysis of glass fragments
 Ha = Target precision calculated using modified version of Horowitz equation for data quality 2 (Ha = 0.01Xa^{0.0495})

s.d.m. = Standard deviation of population mean
 mean = Mean element concentration for all techniques reporting
 Max. = Maximum element/oxide concentration reported
 Min. = Minimum element/oxide concentration reported
