

G-probe 20 Summary Report  
October 25, 2018  
Stephen Wilson

A total of thirty labs submitted final results during this stage of the G-probe 20 study. Technique breakdown was, twenty labs used LA-ICP-MS, two used SEM, and nine used EPMA. Three labs reported results using multiple techniques or provided multiple datasets. In a departure from previous G-probe studies the median concentration value determined in the study was used as the target value.

Starting material for this test sample was derived from an archived glass sample prepared in 1976 at the Corning Glass Works for the USGS. The starting material (GSE) was used as a six-step emission spectroscopy calibration material (Myers A.T., et al, 1976, USGS professional paper 1013). The glass was converted to a basalt matrix (BCR-2) through the addition of specific reagent grade compounds ( $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$ ,  $\text{CaO}$ ,  $\text{TiO}_2$ ). Conversion of glass was accomplished at the USGS by melting 780 g in a one liter platinum bowl at 1325° C over a period of six hours. At the end of the melting period the molten material was poured into a platinum boat and rapidly lowered into a water bath for quenching. Twenty grams of random fragments were selected, ground and then split into representative aliquots for bulk analysis testing. Samples were analyzed for their total element content using techniques at the USGS and Agat Laboratories, Canada.

Below you will find summary results for each element studied in this test. In the element diagrams you will find information for each technique providing a value. Also included is the target value (♦) and calculated precision ( $X \pm Ha$ ) (◆) based on the Horowitz equation. A figure is also presented representing the data compilation for the entire study when more than one technique reported values. The study median is represented by ■, the standard deviation of the median by ▨ and the maximum and minimum values by □. This study median is calculated primarily for the analysis of the major elements where multiple techniques provided data. For each technique an average value is presented (ex. LA-ICP-MS, ▲) as well as ± one standard deviation (ex. LA-ICP-MS, △), and the maximum and minimum values reported (ex. LA-ICP-MS, △).

Table 1. Symbols used on figures 1 through 53

<u>Symbol type</u>	<u>Represents</u>
Large solid symbol,	● Study or method average
Small solid symbol,	● Study or method one standard deviation
Large open symbol,	○ Study or method Maximum or Minimum

X<sub>a</sub> = Target value - GP-20 compiled median results  
H<sub>a</sub> = Target precision calculated using modified version of Horowitz equation

s.d.m. = Standard deviation of population mean  
for data quality 2 (H<sub>a</sub> = 0.01X<sub>a</sub><sup>0.0485</sup>)

GP-20 med. = Median element concentration for all techniques reporting  
Max. = Maximum element/oxide concentration reported  
Min. = Minimum element/oxide concentration reported
